Contact Information

Technical Assistance Center

The Raisecom TAC is available to all customers who need technical assistance with a Raisecom product, technology, or, solution. You can communicate with us through the following methods:

Address: 2nd Floor, South Building of Rainbow Plaza, No.11 Shangdi Information Road,
Haidian District, Beijing 100085

Tel: +86-10-82883305

Fax: +86-10-82883056

World Wide Web

You can access the most current Raisecom product information on the World Wide Web at the following URL:

<http://www.raisecom.com>

Feedback

Comments and questions about how the ... system software works are welcomed. Please review the FAQ in the related manual, and if your question is not covered, send email by using the following web page:

<http://www.raisecom.com/en/xcontactus/contactus.htm>.

If you have comments on the ... specification, instead of the web page above, please send comments to:

export@raisecom.com

We hope to hear from you!

Preface

About This Manual

This manual introduces primary functions of the configuration management software for RC series products.

Who Should Read This Manual

This manual is a valuable reference for sales and marketing staff, after service staff and telecommunication network designers. For those who want to have an overview of the features, applications, structure and specifications of ... device, this is also a recommended document.

Relevant Manuals

《Raisecom NView System User Manual》

《Raisecom Nview System Installation and Deployment Manual》

《... User Manual》

《... Commands Notebook》

Organization

This manual is an introduction of the main functions of ... EMS. To have a quick grasp of the using of the EMS of ... , please read this manual carefully. The manual is composed of the following chapters

Chapter 1 Overview

This chapter briefly introduces the basic function of ...

Chapter 2 Configuration Management

This chapter mainly introduces the central site configuration management function of the

Chapter 3 Performance Management

This chapter focuses on performance management function of

Chapter 4 Device Maintenance Management

This chapter introduces the device maintenance management function of

Appendix A Alarm Type

The alarm types supported by

Compliance

The RC series products developed by Raisecom are strictly complied with the following standards as well as ITU-T, IEEE, IETF and related standards from other international telecommunication standard organizations:

YD/T900-1997 SDH Equipment Technical Requirements - Clock

YD/T973-1998 SDH 155Mb/s and 622Mb/s Technical conditions of optical transmitter module and receiver module

YD/T1017-1999 Network node interface for the Synchronous Digital Hierarchy (SDH)

YD/T1022-1999 Requirement of synchronous digital hierarchy (SDH) equipment function

YD/T1078-2000 SDH Transmission Network Technique Requirements-Interworking of Network Protection Architectures

YD/T1111.1-2001 Technical Requirements of SDH Optical Transmitter/Optical Receiver Modules—2.488320 Gb/s Optical Receiver Modules

YD/T1111.2- 2001 Technical Requirements of SHD Optical Transmitter/Optical Receiver Modules—2.488320 Gb/s Optical Transmitter Modules

YD/T1179- 2002 Technical Specification of Ethernet over SDH

G.703 Physical/electrical characteristics of hierarchical digital interfaces

G.704 Synchronous frame structures used at 1544, 6312, 2048, 8448 and 44 736 kbit/s hierarchical levels

G.707 Network node interface for the synchronous digital hierarchy (SDH)

G.774 Synchronous digital hierarchy (SDH) - Management information model for the network element view

G.781 Synchronization layer functions

G.783 Characteristics of synchronous digital hierarchy (SDH) equipment functional blocks

G.784 Synchronous digital hierarchy (SDH) management

G.803 Architecture of transport networks based on the synchronous digital hierarchy (SDH)

G.813 Timing characteristics of SDH equipment slave clocks (SEC)

G.823 The control of jitter and wander within digital networks which are based on the 2048 kbit/s hierarchy

G.825 The control of jitter and wander within digital networks which are based on the synchronous digital hierarchy (SDH)

G.826 End-to-end error performance parameters and objectives for international, constant bit-rate digital paths and connections

G.828 Error performance parameters and objectives for international, constant bit-rate synchronous digital paths

G.829 Error performance events for SDH multiplex and regenerator sections

G.831 Management capabilities of transport networks based on the synchronous digital hierarchy (SDH)

G.841 Types and characteristics of SDH network protection architectures

G.842 Interworking of SDH network protection architectures

G.957 Optical interfaces for equipments and systems relating to the synchronous digital hierarchy

G.691 Optical interfaces for single channel STM-64 and other SDH systems with optical amplifiers

G.664 Optical safety procedures and requirements for optical transport systems

I.731 ATM Types and general characteristics of ATM equipment

I.732 ATM Functional characteristics of ATM equipment

IEEE 802.1Q Virtual Local Area Networks (LANs)

IEEE 802.1p Traffic Class Expediting and Dynamic Multicast Filtering

IEEE 802.3 CSMA/CD Access Method and Physical Layer Instruction

CONTENTS

Chapter 1	Overview	15
1.1	Basic switch functions	15
1.2	Layer-2 function	15
1.3	Management function	15
1.4	Protocols that the functions are based on	16
Chapter 2	Commands Line	17
2.1	Introduction to commands line	17
2.2	Commands line usage configuration	17
2.2.1	Commands line mode configuration	17
2.2.2	Getting Help	18
2.2.3	Using Editing Features	19
2.2.4	Command-line History	20
2.2.5	The command-line Error	20
Chapter 3	System	21
3.1	File Management	21
3.1.1	Profile Management	21
3.1.2	BOOTROM file management	21
3.1.3	System File Management	22
3.1.4	FPGA files management	22
3.1.5	A typical configuration example	23
3.2	Switch Management	24
3.2.1	Console Management	24
3.2.2	Telnet management	25
3.2.3	SSH management	26
3.2.4	Cluster 'rcommand' Management	27
3.2.5	NMS Management	28
3.2.6	User Logging Management	29
3.2.7	Expended OAM Management	29
3.3	Keepalive Function	30
3.3.1	The Introduction To Keepalive Principle	30
3.3.2	Keepalive Default Configuration	30
3.3.3	Keepalive Configuration	30
3.3.4	Monitoring And Maintenance	31
3.3.5	An Example Of Typical Configuration	31
3.4	Task Scheduling Function	32
3.4.1	The Introduction To Task Scheduling Function Principle	32
3.4.2	Task Scheduling Configuration	32
3.4.3	Monitoring And Maintaining	33
3.4.4	Typical Configuration	33
3.5	Fault Location	33
3.5.1	Fault Location Principle	33
3.5.2	Memory Show	33
3.5.3	Port Driver Memory Pool Show	33
3.5.4	Port UP/DOWN History	34
3.5.5	Fault Location Information Summarize Show	34
3.6	Ping Diagnose Function	34
3.6.1	Ping Principle	34
3.6.2	Ping Configuration	34
3.6.3	Typical Configuration Example	35
3.7	Tracerout Diagnose	36
3.7.1	Traceroute Principle	36
3.7.2	Traceroute Configuration	36
3.7.3	Typical Configuration Example	37
3.8	Telnetd	38
3.8.1	Telnetd Principle	38
3.8.2	Telnet Default Configuration	38
3.8.3	Telnetd Configuration	38
3.8.4	Typical Configuration Example	39
3.9	Watchdog Function	39
3.9.1	Watchdog Principle	39
3.9.2	Configure Watchdog	39

3.9.3	Typical Configuration Example	39
Chapter 4	Mirroring	40
4.1	Local Port Mirror Function Principle	40
4.2	Local Port Mirror Function Configuration	40
4.2.1	The Default Configuration	40
4.2.2	Local Port Mirroring Function configuration	41
4.2.3	Monitoring And Maintaining	41
4.2.4	Typical Configuration Example	42
4.3	Mirroring Data Control Function	42
4.3.1	Mirroring Data Control Default Configuration	42
4.3.2	Mirror Data Control Configuration	42
4.3.3	Monitoring And Maintaining	43
4.3.4	Typical Configuration Example	43
4.4	VLAN Stream Mirror Function	44
4.4.1	Configure VLAN Stream Mirror Function	44
4.4.2	Monitoring And Maintaining	45
4.4.3	Typical Configuration Example	45
Chapter 5	Rate Limiting & Shaping	46
5.1	Port rate limiting and shaping principle	46
5.2	Speed limitation and reshaping based on port function configuration	47
5.2.1	The default configuration	47
5.2.2	Port speed limitation and reshaping function	48
5.2.3	Monitoring and maintaining	51
5.2.4	Typical configuration example	51
5.3	Speed limitation and reshaping function based on VLAN configuration	53
5.3.1	The default configuration	53
5.3.2	Speed limitation and reshaping function based on VLAN configuration	53
5.3.3	Monitoring and maintaining	53
5.3.4	Typical configuration example	54
Chapter 6	MAC Address Table	55
6.1	MAC transmission table management introduction	55
6.1.1	MAC address transmission table	55
6.1.2	MAC address learning	55
6.1.3	MAC address table management	56
6.2	MAC address transmission table management configuration	56
6.2.1	The default MAC address transmission table configuration	56
6.2.2	Static MAC address configuration	57
6.2.3	MAC address aging time configuration	57
6.2.4	MAC address learning enable/disable	58
6.2.5	Clear MAC address table	58
6.2.6	Configure static MAC address privilege	58
6.2.7	enable/disable static MAC strategy	59
6.2.8	Enable/disable static MAC address non-rate-limit	60
6.2.9	Monitoring and maintaining	60
6.2.10	Typical configuration example	61
6.3	MAC address number limit	62
6.3.1	Configure the default MAC address number limit	62
6.3.2	Configure the MAC address number	62
6.3.3	Monitoring and maintaining	62
6.3.4	Typical configuration example	63
6.4	Shared VLAN learning function	63
6.4.1	The default SVL configuration	63
6.4.2	SVL configuration	64
6.4.3	Monitoring and maintaining	64
6.4.4	Typical configuration example	65
Chapter 7	Port Rate	66
7.1	Physical ports features	66
7.2	The default configuration for physical ports	66
7.3	Rate and duplex mode configuration	66
7.4	Configure IEEE 802.3X flow control function	68
7.5	Auto-MDIX function configuration	71
7.6	Line detection function	72
7.7	Maximum transmission unit configuration	73
7.8	Add description for interfaces	74
7.9	Open and close physical layer port	74
7.10	Monitoring and maintaining	75

Chapter 8 Storm Control	77
8.1 Storm control introduction	77
8.2 The default configuration for storm control function	77
8.3 Storm control function configuration	77
8.3.1 Enable/disable storm control function	77
8.3.2 Storm control number	77
8.4 Monitoring and maintaining	78
8.4 Typical configuration example	78
Chapter 9 Layer-2 Protocol Transparent Transmission	80
9.1 Layer-two protocol transparent transmission principle	80
9.2 Layer-two protocol transparent transmission configuration	80
9.2.1 Layer-two protocol transparent transmission default configuration	80
9.2.2 Layer-two protocol transparent transmission configuration	81
9.2.3 Layer-two protocol transparent transmission speed limit configuration	82
9.2.4 Layer-two protocol transparent transmission message statistics clear	82
9.2.5 Monitoring and maintaining	83
9.2.6 Typical configuration example	83
Chapter 10 Layer-3 Interface	85
10.1 Layer-three interface introduction	85
10.2 Layer-three interface configuration	85
10.3 Monitoring and maintaining	85
10.4 Typical configuration example	86
10.5 Layer-three interface configuration debugging	86
Chapter 11 Link Aggregation	87
11.1 Link aggregation function principle	87
11.2 Static aggregation function configuration	87
11.2.1 Static aggregation default configuration	87
11.2.2 Configure static aggregation	87
11.2.3 Monitoring and maintaining	89
11.2.4 Typical configuration example	89
Chapter 12 STP	91
12.1 STP/RSTP principle introduction	91
12.1.1 STP purpose	91
12.1.2 STP message	91
12.1.3 STP overview	91
12.1.4 STP basic principle	92
12.1.5 RSTP principle overview	94
12.1.6 STP related protocol and standard	94
12.2 Configure STP	94
12.2.1 Default STP configuration	94
12.2.2 Root bridge/back-up root bridge	95
12.2.3 Port priority configuration	95
12.2.4 Switch priority configuration	95
12.2.5 Path cost configuration	95
12.2.6 Maximum port transmitting rate configuration	96
12.2.7 STP timer configuration	96
12.2.8 Configure edge port	97
12.2.9 STP mcheck operation	97
12.2.10 Configure STP/RSTP mode switch	97
12.2.11 Configure link type	98
12.2.12 Statistics clear configuration	98
12.2.13 Monitoring and maintaining	99
12.2.14 Typical configuration instance	99
12.3 MSTP principle introduction	100
12.3.1 MSTP overview	100
12.3.2 MSTP principle	100
12.4 MSTP configuration	101
12.4.1 The default MSTP configuration	101
12.4.2 MSTP domain configuration	101
12.4.3 Configure MSTP domain maximum hop number	102
12.4.4 Configure root bridge/back-up root bridge	102
12.4.5 Configure the port priority	103
12.4.6 Configure the switch priority	104
12.4.7 Configure the network diameter of the switch network	104
12.4.8 Path cost configuration	105
12.4.9 Configure the port's maximum sending rate	106

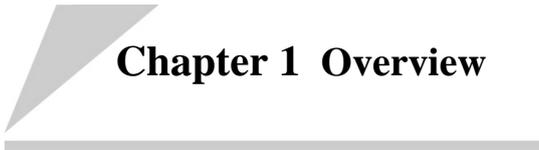

12.4.10	Configure STP timer	106
12.4.11	Configure edge port	107
12.4.12	STP mcheck operation	108
12.4.13	Configure STP/MSTP mode switch	108
12.4.14	Configure link type	108
12.4.15	Configure static clear	109
12.5	Maintaining and management	109
12.5.1	Show instances	110
12.5.2	Show MST domain configuration information	111
12.5.3	Show multi-spanning tree instance basic information	111
12.5.4	Show multi-spanning tree instance detail	113
12.5.5	Show the basic information of multi-spanning tree instance port list	117
12.5.6	Show the detail of multi-spanning tree instance port list	117
12.6	Typical configuration instance	118
Chapter 13	SFP Digital Diagnoses	121
13.1	Digital diagnoses principle	121
13.2	Configure digital diagnoses function for optical module	122
13.2.1	Default digital diagnoses configuration	122
13.2.2	Configure optical module parameter state unusual alarm	122
13.2.3	Optical module digital diagnostic parameter monitoring and maintenance	122
Chapter 14	Multicast	123
14.1	Multicast Overview	123
14.1.1	The confusion of unicast/broadcast	123
14.1.2	The advantage of multicast	124
14.2	IGMP Snooping Configuration	125
14.2.1	About IGMP Snooping protocol	126
14.2.2	IGMP snooping configuration	126
14.2.3	Monitoring and maintenance	131
14.2.4	Typical configuration example	132
14.2.5	IGMP snooping trouble shooting	132
14.3	MVR Configuration	133
14.3.1	MVR principle	133
14.3.2	MVR proxy principle	134
14.3.3	IGMP filtration introduction	134
14.3.4	MVR configuration	134
14.3.5	MVR monitoring and maintaining	137
14.3.6	Configure MVR Proxy	139
14.3.7	MVR Proxy monitoring and maintenance	141
14.3.8	IGMP filter configuration	142
14.3.9	IGMP filter monitoring and maintenance	145
14.3.10	Typical configuration example	146
14.3.11	MVR, MVR Proxy and IGMP filter trouble shooting	149
Chapter 15	VLAN	150
15.1	VLAN Principle	150
15.1.1	IEEE802.1Q VLAN	150
15.1.2	VLAN Mapping interview	150
15.1.3	Q-IN-Q interview	150
15.2	Switch VLAN Function Configuration	151
15.2.1	VLAN based on port	151
15.2.2	VLAN mapping function	159
15.2.3	Basic Q-IN-Q function	162
15.2.4	Flexible Q-IN-Q function	166
15.3	VLAN Function Configuration	170
15.3.1	Configure VLAN	170
15.3.2	Basic Q-in-Q function	176
15.4	VLAN configuration	179
15.4.1	VLAN based on port	179
Chapter 16	RMON	187
16.1	RMON principle interview	187
16.2	RMON configuration	187
16.2.1	Default RMON configuration	187
16.2.2	RMON static group configuration	187
16.2.3	RMON history statistic and configuration	188
16.2.4	RMON alarm group configuration	188
16.2.5	RMON event group configuration	189
16.2.6	Monitoring and maintenance	189
16.2.7	Typical configuration example	190

Chapter 17 ARP	192
17.1 ARP principle interview	192
17.2 ARP configuration	192
17.2.1 Default ARP configuration	192
17.2.2 Adding dynamic ARP address table item	193
17.2.3 Configure the overtime of ARP dynamic address table item	193
17.2.4 Configure ARP dynamic learning mode	194
17.2.5 Clearing ARP address mapping table	194
17.3 Monitoring and maintenance	194
17.4 Typical configuration example	194
Chapter 18 SNMP	196
18.1 SNMP principle	196
18.1.1 SNMP overview	196
18.1.2 SNMP V1/V2 interview	196
18.1.3 SNMPv3 interview	196
18.2 SNMPv1/v2/v3 management configuration	197
18.2.1 Default SNMP configuration	197
18.2.2 SNMPv1/v2 configuration	198
18.2.3 SNMPv3 configuration	199
18.2.4 SNMP v1/v2 TRAP configuration	201
18.2.5 SNMPv3 Trap configuration	201
18.2.6 Other SNMP configuration	202
18.2.7 Monitoring and maintenance	203
18.2.8 Typical configuration example	203
Chapter 19 Cluster	207
19.1 Cluster management introduction	207
19.1.1 Cluster definition	207
19.1.2 Cluster role	207
19.1.3 Cluster principle	207
19.2 Configure RNDP function	208
19.2.1 Default RNDP function configuration	208
19.2.2 Configure RNDP function	208
19.2.3 Monitoring and maintenance	208
19.2.4 Typical configuration example	209
19.3 RTDP function configuration	210
19.3.1 Default RTDP function configuration	210
19.3.2 RTDP function configuration	210
19.3.3 Monitoring and maintenance	210
19.3.4 Typical configuration example	211
19.4 Cluster management function configuration	213
19.4.1 Default cluster management function configuration	213
19.4.2 Cluster management equipment function configuration	213
19.4.3 Cluster member equipment function configuration	214
19.4.4 Add and activate cluster member	215
19.4.5 Delete and suspend cluster member	215
19.4.6 Cluster member remote access	216
19.4.7 Monitoring and maintenance	216
19.4.8 Typical configuration example	217
Chapter 20 System	220
20.1 System log function introduction	220
20.1.1 System log function overview	220
20.1.2 System log format	220
20.2 Configure system log function	220
20.2.1 Default system log configuration	220
20.2.2 Configure system log source	220
20.2.3 Configure system log output	222
20.2.4 Monitoring and Maintenance	224
20.2.5 Typical configuration example	225
Chapter 21 System Clock	227
21.1 System clock management overview	227
21.2 System clock configuration function	227
21.2.1 Default system clock configuration	227
21.2.2 Configure system clock function	227
21.2.3 Configure time zone management function	227
21.2.4 Configure summer time function	228
21.2.5 Monitoring and maintenance	229
21.2.6 Typical configuration example	229

21.3	Configure SNTP function	230
21.3.1	Default SNTP protocol configuration	230
21.3.2	Configure SNTP protocol function	230
21.3.3	Monitoring and maintenance	230
21.3.4	Typical configuration example	230
Chapter 22	Loopback Detection	232
22.1	Loopback detection introduction	232
22.2	Default port loopback detection configuration	232
22.3	Configure loopback detection function	232
22.4	Monitoring and maintenance	234
22.5	Typical configuration example	234
Chapter 23	ACL	239
23.1	Configuration Description	239
23.2	ACL Introduction	239
23.3	IP ACL Configuration	239
23.3.1	IP ACL Default Configuration	239
23.3.2	IP ACL Configuration	239
23.3.3	Monitoring and Maintenance	240
23.3.4	Specific Configuration Example:	240
23.4	MAC ACL Function	241
23.4.1	MAC ACL Default Configuration	241
23.4.2	MAC ACL Configuration	241
23.4.3	Monitoring and Maintenance	242
23.4.4	Specific Configuration Examples	242
23.5	MAP ACL Function	242
23.5.1	MAP ACL Default Configuration	243
23.5.2	MAP ACL Configuration	243
23.5.3	Monitoring and Maintenance	249
23.5.4	Specific Configuration Example	249
23.6	Application Configuration Based on Hardware ACL	249
23.6.1	Application Default Configuration Based on Hardware ACL	250
23.6.2	Application Configuration Based on Hardware ACL	250
23.6.3	Monitoring and Maintenance	252
23.6.4	Specific Configuration Examples	252
23.7	Configuration Function Based on Software IP ACL	253
23.7.1	Application Default Configuration Based on Software IP ACL	253
23.7.2	Layer-3 Interface Protect Configuration Based on IP ACL	254
23.7.3	Monitoring and Maintenance	254
23.7.4	Specific Configuration Example	254
Chapter 24	QoS	255
24.1	Configuration Description	255
24.2	QoS Introduction	255
24.2.1	Introduction	255
24.2.2	Classification	257
24.2.3	Policy and Marking	258
24.2.4	Bit-Rate Limitation and Reshaping	259
24.2.5	Mapping Table	259
24.2.6	Queueing and Scheduling	260
24.2.7	QoS Default Configuration	260
24.3	QoS Enable and Disable	261
24.3.1	QoS Start and Stop Default Configuration	261
24.3.2	QoS Start and Close Default Configuration	261
24.3.3	Monitoring and Maintenance	262
24.3.4	Configuration Examples	262
24.4	Classification Function Configuration	262
24.4.1	Classification Default Configuration	262
24.4.2	Flow Classification Configuration Based on Port TRUST Status	262
24.4.3	Configuring Flow Classification on ACL/class-map	266
24.4.4	Monitoring and Maintenance	268
24.4.5	Typical Configuration Examples	270
24.5	Policy and Marking Function Configuration	271
24.5.1	Policy and Marking Default Configuration	271
24.5.2	Policy and Marking Configuration	271
24.5.3	Monitoring and Maintenance	276
24.5.4	Specific Configuration Examples:	278
24.6	Bit-Rate Limitation and Reshaping Function Configuration	279

24.6.1	Bit-Rate Limitation and Reshaping Default Configuration-----	279
24.6.2	Configuration Based on Bit-Rate and Reshaping of Data Flow -----	279
24.6.3	Monitoring and Maintenance -----	280
24.6.4	Specific Configuration Examples -----	280
24.7	Map Function Configuration -----	281
24.7.1	Map Default Configuration -----	281
24.7.1	CoS-DSCP map List Configuration -----	282
24.7.2	IP-Precedence-DSCP Map List Configuration -----	283
24.7.3	DSCP-CoS Map List Configuration -----	284
24.7.4	DSCP-MUTATION Map List Configuration -----	285
24.7.5	CoS-queue Map List Configuration -----	288
24.7.6	Set Ports Based on smac, dmac, vlan's Frame Priority and Priority Override Function-----	289
24.7.7	Monitoring and Maintenance -----	290
24.7.8	Specific Configuration Examples -----	293
24.8	Queue and Adjust Function Mode -----	293
24.8.1	Queue and Adjust Default Configuration -----	293
24.8.2	SP Configuration -----	293
24.8.3	WRR Configuration -----	293
24.8.4	SP+WRR Configuration -----	293
24.8.5	Monitoring and Maintenance -----	294
24.8.6	Specific Configuration Examples -----	294
24.9	QoS Trouble Shoot -----	295
24.10	QoS Command Reference -----	295
Chapter 25	802.3ah OAM -----	299
25.1	802.3ah OAM Principle Introduction -----	299
25.1.1	OAM mode -----	299
25.1.2	OAM loop-back -----	299
25.1.3	OAM events -----	299
25.1.4	OAM mib -----	300
25.2	802.3ah OAM Mode Configuration -----	300
25.3	802.3ah OAM Active Mode Function -----	301
25.3.1	OAM default configuration -----	301
25.3.2	OAM enable/disable configuration function -----	301
25.3.3	Run OAM loop-back function -----	302
25.3.4	Opposite OAM event alarm function -----	304
25.3.5	View opposite IEEE 802.3 Clause 30 mib -----	304
25.3.6	OAM statistics clear function -----	305
25.3.7	Monitoring and maintenance -----	305
25.3.8	Configuration example -----	306
25.4	802.3ah OAM Passive Function -----	307
25.4.1	OAM default configuration -----	307
25.4.2	OAM enable/disable configuration -----	307
25.4.3	Response/ignore opposite OAM loop-back configuration function -----	309
25.4.4	OAM link monitor configuration function -----	309
25.4.5	OAM fault indication function -----	311
25.4.6	Local OAM event alarm function -----	311
25.4.7	IEEE 802.3 Clause 30 mib support -----	312
25.4.8	OAM statistics clear function -----	312
25.4.9	Monitoring and maintenance -----	314
25.4.10	Configuration example -----	314
Chapter 26	Extended OAM -----	315
26.1	Extended OAM principle overview -----	315
26.2	Extended OAM management -----	315
26.2.1	Default extended OAM configuration -----	315
26.2.2	Extended OAM configuration mode -----	316
26.2.3	Remote equipment system configuration -----	316
26.2.4	Configure extended OAM protocol -----	317
26.2.5	Configure remote equipment port -----	318
26.2.6	Upload/download files from remote equipment -----	321
26.2.7	Configure remote equipment to network management enabled equipment -----	325
26.2.8	Save remote equipment configuration information to local end -----	327
26.2.9	Reset remote equipment -----	328
26.2.10	Extended OAM statistic clear function -----	328
26.2.11	Monitoring and maintenance -----	328
26.2.12	Typical configuration example -----	329
Chapter 27	DHCP -----	330
27.1	System Overview -----	330
27.1.1	DHCP Snooping principle -----	330

27.1.2 Configure DHCP Snooping	332
27.1.3 Monitoring and maintaining	334
27.1.4 Typical configuration example	335
27.1.5 DHCP snooping trouble shooting	337
27.2 DHCP Server Configuration	337
27.2.1 DHCP Server principle overview	338
27.2.2 Configure DHCP Server	338
27.2.3 Monitoring and maintaining	344
27.2.4 Typical configuration example	346
27.3 DHCP Relay Configuration	349
27.3.1 DHCP Relay principle overview	349
27.3.2 Configure DHCP Relay	351
27.3.3 Monitoring and maintaining	357
27.3.4 Typical configuration example	359
27.3.5 DHCP Relay trouble shooting	361
27.4 DHCP Option Configuration	361
27.4.1 DHCP Option principle overview	361
27.4.2 DHCP Option configuration	361
27.4.3 Monitoring and maintenance	363
27.4.4 Typical configuration example	363
27.4.5 DHCP OPTION trouble-shooting	364
Chapter 28 DHCP Client	365
28.1 DHCP client overview	365
28.2 Configure DHCP Client	366
28.2.1 Default DHCP Client configuration	366
28.2.2 DHCP Client configuration guide	366
28.2.3 Configure IP port 0 applying IP address by DHCP	367
28.2.4 DHCP Client renewal	367
28.2.5 DHCP Client release IP address	368
28.2.6 Configure hostname/class-id/client-id	368
28.3 Monitoring and maintenance	369
28.4 Typical configuration example	370
28.5 DHCP Client trouble shooting	371
Chapter 29 802.1x	375
29.1 802.1x principle overview	375
29.2 Configure 802.1x	376
29.2.1 Default 802.1x configuration	376
29.2.2 Basic 802.1x configuration	376
29.2.3 802.1x reauthorization configuration	378
29.2.4 Configure 802.1x timer	378
29.2.5 802.1x statistics cleanup	380
29.2.6 Maintenance	380
29.2.7 Configuration example	380

Chapter 1 Overview

1.1 Basic switch functions

- Mirror function: including the mirror that is from any port to one port, which is used for network data monitoring and analysis.
- System log: multiply log display mode is supported.
- System clock: SNTP time synchronization and manual configuration is supported.
- Task scheduling: with this function a certain command can be executed seasonally.

1.2 Layer-2 function

- MAC address table management: static MAC configuration and dynamic MAC learning are supported.
- Physical layer interface configuration: including rate and duplex mode configuration, 802.3x flowcontrol function and port enable/disable.
- Storm control: including broadcast, multicast and DLF frame control.
- Message relay and transmission: including the option of protocol messages or DLF message.
- Link aggregation: including aggregated link load balance.
- DHCP configuration: including DHCP Server, DHCP Relay and DHCP Snooping function, with the legal DHCP server user can get IP address automatically.
- ARP management: including static and dynamic ARP address table maintainance.
- Loopback detection: aiming at the network trouble caused by Loop, it develops the robustness, fault tolerance and debugging ability of the network.
- VLAN configuration: including basic VLAN configuration, Q-in-Q and flexible Q-in-Q function.
- Shared VLAN: SVL mode is supported.
- RST configuration: IEEE 802.1w rapid spanning tree protocol is supported.
- MST configuration: IEEE 802.1Q multiply spanning tree protocol is supported.

1.3 Management function

- Basic management:
 - Management using CONSOLE is supported;
 - Remote management with TELNET is supported;
 - Auto-configuration is supported, that is to download configuration files automatically from network management configuration server and realize network management configuration.
- SNMP configuration: SNMP v1, SNMP v2 and SNMP v3 is supported.
- RMON configuration: you can use different network agent and manage-station system to monitor network data, now RMON1, 2, 3, 9 groups are supported.
- Cluster management: with Raisecom cluster management function, network administrator is able to manage several switches using the public IP address of the main switch. Three protocols are included: RNDP, RTDP and RCMP.
- Bandwidth management function configuration: rate-limit based on port or VLAN is supported.
- ACL and network security configuration: multiply access list configuration is supported, you can sort and filter the packets according to the matching list.
- QoS function: specific traffic control, it offers end to end quality of service guarantee for user's service.
- OAM configuration: IEEE802.3ah is supported
- Extended OAM configuration: management and monitor remote devices with IEEE802.3ah OAM link, the main functions include: acquiring and configuring remote device attribution, downloading or uploading remote device files, managing extending OAM link state and statistics.
- Optical module digital diagnoses: SFP fault diagnose function is supported.

1.4 Protocols that the functions are based on

- RST: IEEE 802.1w;
- MST: IEEE 802.1Q;
- OAM: IEEE 802.3ah;
- Port flowcontrol function: IEEE 802.3x.

Chapter 2 Commands Line

2.1 Introduction to commands line

Commands Line is the channel for the communication between subscribers and switches. In the commands lines, subscribers is able to monitor, control and manage the switches through configuring the corresponding commands. For better convenience, subscribers can edit shortcuts to use the commands, by the same time subscribers can examine the used commands through transferring the history. The commands line mode confines the way different subscribers use commands lines, where various commands line modes are offered. Subscribers can make certain configuration only in the corresponding mode.

2.2 Commands line usage configuration

2.2.1 Commands line mode configuration

Mode	Mode description	Access	Prompt	Out
Universal subscriber mode	Subscriber is allowed to configure the basic information and the parameter shown on the switch.	Login the switch and enter the user's name and password.	Raisecom>	Exit Withdraw from the current mode.
Subscriber privileges mode	Subscriber is allowed to configure the basic information of the switch, like system time and the name of the switch, except the operation information.	From universal subscriber mode, type enable and password.	Raisecom#	Exit Withdraw from the current mode.
Global configuration mode	Subscriber is allowed to configure all the operation parameters.	From subscriber privilege mode, type config	Raisecom(config)#	Exit Withdraw from the current mode.
Physical layer interface configuration mode	Subscriber is allowed to configure the Ethernet physical interface of the switch.	From global configuration mode, type interface port portid.	Raisecom(config-port)#	Exit Withdraw from the current mode.
Physical layer interface bulk configuration mode	Subscriber is allowed to range configure the parameter of the switch's Ethernet physical interface.	From global mode, type interface port portid.	Raisecom(config-range)#	Exit Withdraw from the current mode.

Three-tier interface configuration mode	Subscriber is allowed to configure the switch's three-tier Ethernet interface.	From global mode, type interface port ip id .	Raisecom(config-ip)#	Exit Withdraw from the current mode.
VLAN configuration mode	Subscriber is allowed to configure the VLAN operation parameters.	Enter vlan	Raisecom(config-vlan)#	Exit Withdraw from the current mode.
Class Map configuration mode	Subscriber is allowed to configure the given data flow.	From global configuration mode, type class-map class-map-name [match-all match-any] command.	Raisecom(config-cmap)#	Exit Withdraw from the current mode.
Policy Map configuration mode	Subscriber is allowed to classify and package the data flow defined by class-map.	From global configuration mode, type policy-map policy-map-name command.	Raisecom(config-pmap)#	Exit Withdraw from the current mode.
Traffic classification configuration mode	Subscriber is allowed to configure the action of the data flow.	From policy map exec mode, type class-map class-name command.	Raisecom(config-pmap-c)#	Exit Withdraw from the current mode.
The cluster configuration mode	Subscriber is allowed to configure the cluster.	From global configuration mode, type cluster command.	Raisecom(config-cluster)#	Exit Withdraw from the current mode.
Access control list mapping table configuration mode	Subscriber is allowed to configure the access control list mapping table.	From global configuration mode, type access-list-map <0-399> {permit / deny} command.	Raisecom(config-aclmap)#	Exit Withdraw from the current mode.
Subscriber network mode	Subscriber is allowed to configure three-tier network setting, show the users' network information and network tools.	Form global configuration mode, type user-network diagnostics .	Raisecom(config-usrnet)#	Exit Withdraw from the current mode.
RIP configuration mode	Subscriber is allowed to configure RIP.	Form global configuration mode, type router rip .	Raisecom(config-router-rip)#	Exit Withdraw from the current mode.
OSPF configuration mode	Subscriber is allowed to configure OSPF.	From global configuration mode, type router ospf .	Raisecom(config-router-ospf) #	Exit Withdraw from the current mode.

2.2.2 Getting Help

Command	Description
help	Get a short system help both in English and in Chinese.
abbreviated-command-entry?	Get a list for all the available commands that match a particular string prefix (<i>abbreviated-command-entry</i>). For example: ISCOM> en? english enable
abbreviated-command-entry<Tab>	Makeup an incomplete command. For example. Raisecom#show ser<Tab> Raisecom#show service
?	List all the commands under this mode. For example Raisecom#?
command?	List all the key words and options for particular command with a short help information for it. Raisecom#show ?
command keyword ?	List the key words corresponding command For example Raisecom(config)#ip? IP setting ip-access-list Define IP access control list

2.2.3 Using Editing Features

up arrow:	last entered command
down arrow:	next entered command
left arrow:	move a character left
right arrow:	move a character right
backspace:	delete a character in front of the cursor
Ctrl+d:	delete a character at the cursor
Ctrl+a:	move the cursor to the beginning of the command line
Ctrl+e:	move the cursor to the end of the command line
Ctrl+k:	delete all the characters to the right the cursor
Ctrl+w:	delete all the characters to the left of the cursor
Ctrl+u:	delete the row all
Ctrl+z:	exit from other modes to privileged mode

2.2.4 Command-line History

The switch records the latest 20 commands in the cache by default. User can use the following command to set the number of history commands that will be recorded:

Raisecom>**terminal history** <0-20>

Use **history** to show the history command.

2.2.5 The command-line Error

Error	Description	Getting help
Unknown command or in accurate For example Raisecom# sh co % "co" Unknown command.	Review the command needed.	
The command is not confirmed: For example Raisecom# sh r % "r" Unconfirmed command	Input the order that can not be recognized by the switch from the commands.	Add ? for annotation and command. For example: Raisecom# sh r rate-limit: Rate control Rmon: Remote Network Monitoring (RMON) configuration Rndp: RNDP configuration Rtdp: RTDP configuration running-config: Running system configuration information
Command incomplete For example Raisecom# show % "show" Incomplete command.	The switch can not recognize the operation form the command, command that can be recognized is needed.	Add ? for command and annotation. For example: Raisecom# sh r rate-limit:Rate control Rmon: Remote Network Monitoring (RMON) configuration Rndp: RNDP configuration Rtdp: RTDP configuration running-config: Running system configuration information

Chapter 3 System

3.1 File Management

3.1.1 Profile Management

The default configuration storage file name of the system is: **startup_config.conf**. The configuration storage file could be written into the flash file system through the command **write**, and the configuration information will be re-configured automatically the next time the system reboot. Use **erase** to delete the file. The configuration information file **startup_config.conf** could be uploaded to the server or downloaded to the system to replace the original configuration information, through FTP protocol with the command **upload** and **download**. Use **show startup-config** to show the configuration information in storage. Use **show running-config** to show the current configuration information in the system.

Command	Description
write	write the configuration file into the flash file system, and the configuration information in storage will be re-configured automatically after the system rebooting
erase	delete the file
show startup-config	the configuration information in storage
show running-config	The configuration information in the current system

3.1.2 BOOTROM file management

BOOTROM, boot of the switch, initialize the switch. User can upgrade BootROM file through FTP. BootROM file system is called **bootrom**(or **bootromfull**)in default cases. With the command **ftp file-name**, user can set these file system names.

When powered, the switch will run **BootROM** file first. When 'Press space into Bootrom menu...' is shown, user can enter **Bootrom** menu bar by pressing ENTER, and carry out the following operation:

'?' show all the commands available

'h' show all the commands available

'v' show the version of **Bootrom**

'b' quick start executive command

'T' download configuration file through the switch ports

'N' set the MAC address

'R' reboot the switch

3.1.3 System File Management

The documents that keep the equipment running, like host software and configuration files, are kept in the storage devices. For the convenience and efficiency of user's managing the equipment, the equipment manage the documents in the way of Document System. The function of the document system contains catalog's creating and deleting, document's copying and display, and so on. In default cases, the document system will remind user for confirmation if the command may lose any data (like deleting or recovering files).

- With the command **upload** and **download**, program files could be uploaded to the server or downloaded to the system through the TFTP protocol or FTP protocol;
- Use **dir** to look over the system FLASH files;
- Use **show version** to look over the software version;
- Use **clock** to set system time;
- Use **logout** to exit the current system.

Command	Description
dir	To look over the system files
show version	To look over the software version
clock	To set system time
logout	exit

3.1.4 FPGA files management

FPGA(field programmable gate arrays) is the most integrated in Application Specific Integrated Circuit(ASIC). To accomplish user's logic, subscriber can re-configure the logical module and I/O module in FPGA, which can also be used on CPU's simulation. User's programming data to FPGA, stored in FLASH chip, could be uploaded to FPGA when powered and initialized. Online-programming is also available, making the system reconstructed online.

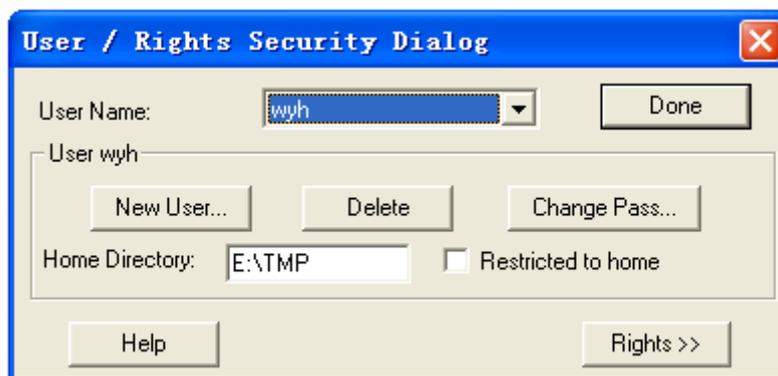

When powered, the FPGA chip will write the data in EPROM into programming ROM and get into working state after the configuration finished. When power off, FPGA will be empty and the logic inside is gone, thus FPGA could be repeated used. There is no special programmer for FPGA programming, the universal EPROM, PROM programmer can fit it. When the function of FPGA needs to be modified, only on piece of EPROM needs to be changed. So, by one FPGA different programming data brings different circuit function.

Command	Description
<p>Upload</p> <p><i>{system-boot/startup-configure/remote-fpga } ftp A.B.C.D username password filename</i></p>	<p>Files are uploaded to server through FTP protocol</p> <p>A.B.C.D:IP destination address</p> <p>username server user name</p> <p>password user's password</p> <p>filename filename(o.0)</p>
<p>download</p> <p><i>{system-boot/startup-configure/bootstrap/remote-fpga} ftp A.B.C.D username password filename</i></p>	<p>By FTP protocol the files are downloaded to the system and replace the files before.</p> <p>A.B.C.D:IP destination address</p> <p>username server user name</p>

	password user's password
	Filename filename(o.0)
upload {system-boot/startup-configure/remote-f pga } tftp A.B.C.D filename	Files are uploaded to server through FTP protocol A.B.C.D :IP destination address Filename filename
download {system-boot/startup-configure/remote-f pga } tftp A.B.C.D filename	Files are uploaded to server through FTP protocol A.B.C.D :IP destination address Filename filename

3.1.5 A typical configuration example

When subscriber has already have his/her own configuration files or new upgrade files, he/she can download the configuration files into the switch. To make it, subscriber should open the FTP software, like wftpd32.exe, and set user name, password and file path. As shown below, user name is wyj, password:123, the path of the configuration file is E:\TMP.

User uses serial line to connect the switch and PC, and connect the line to the switch port, as shown below. Open the terminal emulation program, such as **SecureCRT 5.1**. Take Console management as reference when using Console interface.

User can also use **Upload, download** to upload and download files from FTP. The connection line is shown as figure.

For example:

Using FTP to download system file **ROS_4.3.313.ISCOM2926.31.20080602** to the switch, user should set the switch IP address:20.0.0.10 first, then open the FTP software **wftpd32.exe** and set user name, password, and file path. Input **download** and select **system-boot**, input the host IP address: 20.0.0.10, user name,

password of the FTP software, and all the process is done.

```
Raisecom#config
Raisecom(config)#interface ip 0
Raisecom(config-ip)#ip address 20.0.0.10 1
Set successfully
Raisecom(config-ip)#exit
Raisecom(config)#exit
Raisecom#download startup-config ftp 20.0.0.221 wyh 123
ROS_4.3.313.ISCOM2926.31.20080602
Waiting....Start
Getting from source ...Done
Writing to destination...Size 1754K / 1754K
Success!
```

When the files in switch need to be uploaded to the host, user can use TFTP to upload **startup-config** to the host. To do this, user should set the IP address 20.0.0.10 of the switch, then open the TFTP software **Cisco TFTP Server** to set the file path, input **upload**, host IP address 20.0.0.221, and upload the generated file name WW.

```
Raisecom#config
Raisecom(config)#interface ip 0
Raisecom(config-ip)#ip address 20.0.0.10 1
Set successfully
Raisecom(config-ip)#exit
Raisecom(config)#exit
Raisecom#upload startup-config tftp 20.0.0.221 ww
Waiting....Start
Getting from source ...Done
Writing to destination...Size 1K / 1K
Success!
```

3.2 Switch Management

3.2.1 Console Management

Local control port management means using a console port of a terminal or a PC that is running terminal simulation program to configure and manage the switch. This management approach is out-of-band management, and needs no network for communication. Thus the console port can configure and manage the switch even if the network is not going on well.

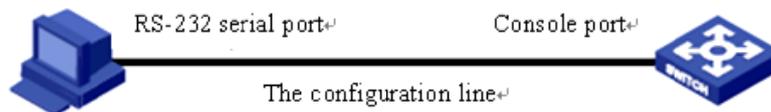

Local management manage the switch by connecting the terminal and console program inside the switch.

To login in the Ethernet switch through the console port, the user's terminal communication parameter

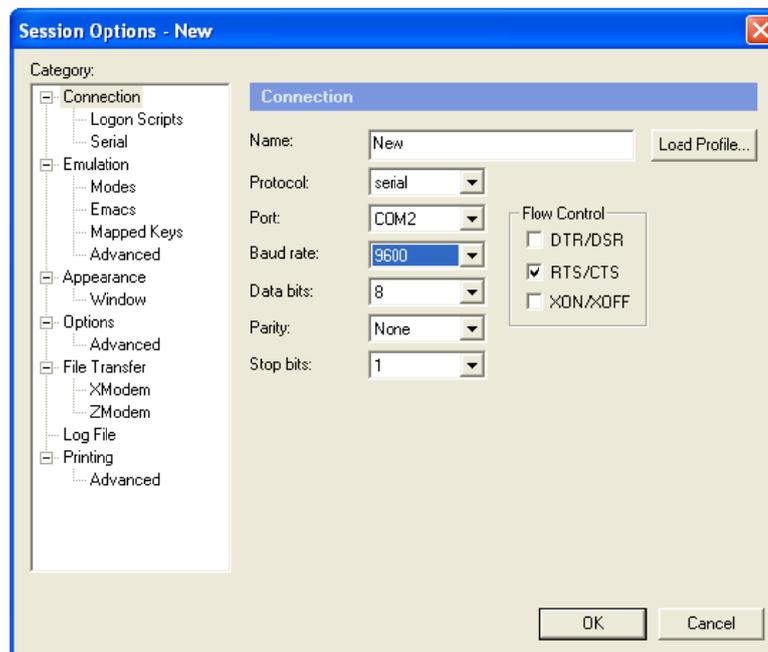

configuration and the configuration of switch's console port should be consistent. The default configuration of the switch's console port is shown below

Attribution	Default value
Baud rate	9600bit/s
Flow control mode	No flow control
Check mode	No check
Stop bit	1
Data bit	8

First, connect the switch console port and the serial port of PC, and keep the PC online. As shown below,

Then, run the terminal simulation program on PC, such as **SecureCRT 5.1**, as is shown below. Select the serial port connected with the switch port, and configure the terminal communication parameter as: baud rate 9600 bit/s, 8 data bits, 1 stop bit, no validation and flow control, serial interrupted default value 100ms.

At last, download the system files to the switch and run it through console port. The calculation of the switch data can also be observed and controlled by computer.

3.2.2 Telnet management

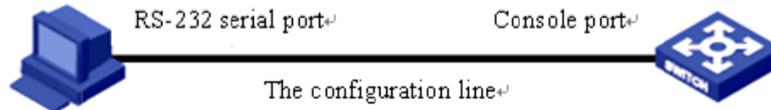

The TELNET protocol aims at offering a communication mechanism which is generally universal, two-way and 8 byte available. Its main objective is letting terminal interface device and the process for terminal interact. In addition, as you can see, the protocol could be used in terminal communication (connection) and process to process communication (distributed computing).

A general thought: a telnet connection is a connection which is used to transfer TCP that contains TELNET control data.

TELNET protocol base on the following 3 ideas mainly: first, virtual network terminals; second, the principle of negotiating options; third, viewing the terminal and process as a balanced approach.

User can make remote management and maintenance through Telnet. Both switch client and telnet client need corresponding configuration so that user can login in the switch by Telnet.

When user login on a switch, the picture following shows the detail:

User can start TELNET services by command:

Step	Command	Description
1	config	Enter global configuration mode
2	interface ip 0	Enter IP port mode
3	ip address A.B.C.D [A.B.C.D] <1-4094>	Configure the IP address A.B.C.D: IP address [A.B.C.D]: subnet mask <1-4094>: vlan number
4	exit	Exit global configuration mode and enter enable mode
5	telnet-server {accept close max-session} port-list	Set telnet services port-list port list
6	show telnet-server	Show telnet configuration

3.2.3 SSH management

3.2.3.1 SSH default configuration

Function	Default value
SSH server status	Stop
Key-pair	No

3.2.3.2 SSH configuration

Before the server start key-pair have to be created. User manage command creating and key-pair deletion by key-pair. User use keys to create command and key-pair, before new key-pair is created, user must delete the key-pair that existed, because only one key-pair can be created on one equipment.

step	Command	Description
1	config	Enter global configuration mode
2	key-pair generate <i>KEYNAME</i> rsa [<i>modulus <768-2048></i>] [<i>comment</i> <i>COMMENT</i>]	Create key pair <i>KEYNAME</i> key-pair name 768-2048 range of the module length <i>COMMENT</i> key-pair comment
3	ssh server <i>KEYNAME</i>	Start SSH server <i>KEYNAME</i> key-pair name
4	exit	Return to global configuration mode
5	show key-pair <i>KEYNAME</i>	Show key-pair information

User can use **no ssh server** to stop SSH server after the SSH server start.

The key-pair will be stored on the equipment automatically after successful creation, until user delete it or the equipment is formatted.

Step	Command	Description
1	config	Enter global configuration mode
2	key-pair destroy <i>KEYNAME</i>	Destroy key-pair
3	exit	Return to global configuration mode
4	show key-pair <i>KEYNAME</i>	Show key-pair information

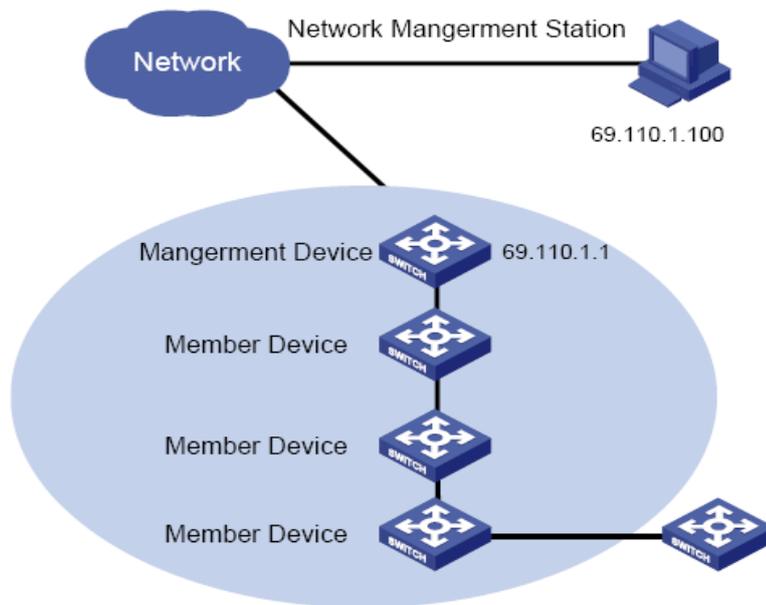

3.2.3.3 Monitoring And Maintaining

Command	Description
show key-pair <i>KEYNAME</i>	Show key-pair information
show ssh server	Show server configuration information
show ssh session	Show SSH dialog information

3.2.4 Cluster ‘rcommand’ Management

3.2.4.1 Cluster ‘rcommand’ Function Introduction

Using Raisecom cluster management function, network administrator is able to manage several switch through a registered IP address of the main switch. The main switch is command facility, while the other switches that are under administration will be member equipments. Member equipment needs not IP address setting usually, it is managed and maintained by manage equipment’s redirection. The typical using environment is shown below:

Cluster management contains three protocol: RNDP (Raisecom Neighbor Discover Protocol), RTDP (Raisecom Topology Discover Protocol) and RCMP (Raisecom Cluster Management Protocol). RNDP see to the facility neighbor discovery and information collection, RTDP see to collecting and handling all the network topology information, while RCMP see to the cluster member's joining, validation, deletion and so on. Among them, RTDP and RCMP communicate in cluster VLAN. So, appropriate configuration to VLAN2 is needed to make sure that RTDP and RCMP communicate normally, when there be facility that does not support Raisecom cluster management function between the two facilities that need cluster management.

Different roles form by the different degrees and functions of each switch in the cluster, but user can constitute a certain switch's role form configuration. The roles in cluster include supervisory unit, member unit and alternate unit.

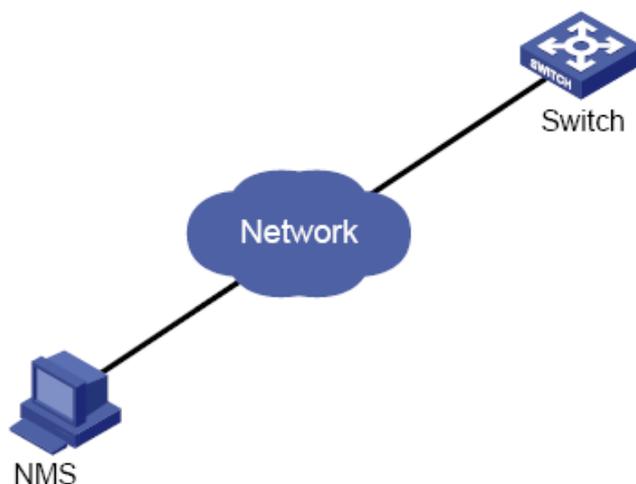

Rcommand, like telnet, can login member switch on the command-line interface of the supervisor switch. Consult cluster management function about configuration and commands of cluster management.

3.2.5 NMS Management

NMS: Network Management System. It has 5 functions: alarming, performance, configuration, safety and accounting. In SNMP, NMS is the workstation running the client program. IBM NetView and Sun NetManager are the usual NMS stations in use. When SNMP Agent receives the query message Get-Request, Get-Next-Request, Get-Bulk-Request about MIB from NMS, Agent carry out **read** or **write** to MIB according to the message style, then create **Response** message according to the operation result and sent it to NMS as response.

On the other side, once SNMP Agent receives any change on facilities like normal/hot booting or anything unusual it will create a **Trap** message and report it to NMS actively.

User can login the switch through NMS, manage and configure the switch by the Agent process on the switch. As shown below.

3.2.6 User Logging Management

User can login, configure and manage the switch by the following way:1, local login from Console port;2, local or remote login using Telnet through Ethernet port;3, login from NMS port. User's name and password is needed when logging, by default username is **raisecom**, password **raisecom**:

Setp	Command	Description
1	user USERNAME password { no-encryption md5 } PASSWORD	User login USERNAME username; PASSWORD password;
2	user USERNAME privilege <1-15>	User login privileges; USERNAME username; <1-15> user privileges grade;
3	Write	Save configuration information
4	show user	Show user information

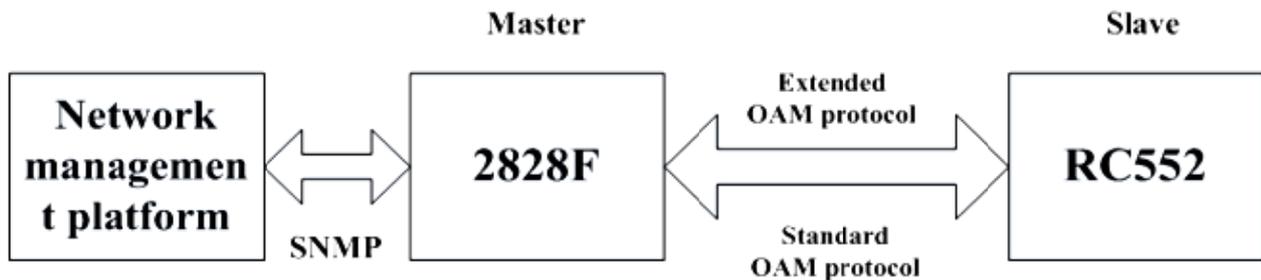

3.2.7 Expended OAM Management

Expended OAM, by IEEE802.3ah OAM link, manage and monitor remote facilities. It contains 3 parts of function:1,acquire and set remote facilities;2, download and upload remote facility files;3, manage the expended OAM line state and stat.. Specific functions are as follows:

- Remote attribution acquirement: local facility can get remote facilities' attribution, configuration and statistics.
- Configuring remote facility basic function: local facility could configure remote facility function by expending OAM, including host name, port enable/disable, port speed duplex, port bandwidth, failover and so on.
- Configuring remote facility management parameter: configure network administration parameter for remote facility that support SNMP network administration, like IP address, gateway, group parameter and VLAN management, and carry out comprehensive network management through SNMP protocol.
- Remote TRAP: when remote facilities find **LINK UP/DOWN** port, the remote port will inform local port by sending expended OAM **notification** frame, then the local port will send remote TRAP alarm to network administrator.
- Expended remote end loopback: the local end is able to manage remote fiber port inner loop

- function, and set the loopback data to decide if CRC needs re-computing.
- Resetting remote facilities: orders from local end is able to reset or reboot remote facilities.
- Other remote facilities' function management: as remote facilities increases, local facility can manage more remote end functions by expend OAM protocol, like SFP, Q-in-Q, virtual line diagnoses and so on.
- Downloading remote end files: remote end files could be downloaded to remote facilities directly from FTP/TFTP server, another way is downloading them from server to local end, then to the remote facilities.
- Uploading remote end files: remote end files could be uploaded to remote facilities directly from FTP/TFTP server, another way is uploading them from server to local end, then to the remote facilities.
- Expanded OAM line stat. and function management.

Expanded OAM network is shown as below. Local switch MASTER:ISCOM2828F; remote end SLAVE: RC552-GE.

Notice: The expanded OAM line could be established only between the local facility and remote facility, that is to say, the facility on each end must be OAM active mode and OAM passive mode respectively.

3.3 Keepalive Function

3.3.1 The Introduction To Keepalive Principle

To find out the facility out of order in time, user needs to acquire the facility information periodically to see if the facility is available and the basic facility information. Users can receive the state of **Keepalive Trap** information collection facility from NMS periodically without any operation. Keepalive module send TRAP periodically to NMS about the basic information of facilities, including facilities' name, facilities' OID, the hardware and software version, MAC address and IP address.

Keepalive module send **keepalive trap** that contains the basic information of the switch to the network administration station, so that the network administration station could find the switch in a short time.

3.3.2 Keepalive Default Configuration

Function	Default value
keepalive trap switch	On
Keepalive alternation	300 seconds

3.3.3 Keepalive Configuration

By default, KEEPALIVE is open on the switch, and the switch send KEEPALIVE trap periodically. By

carrying out the following command in global configuration mode, KEEPALIVE can be set OPEN, CLOSE and PAUSE. If it is CLOSE, the configuration can be loaded. And if it is PAUSE, the configuration can not be saved, the configuration is still default after reboot.

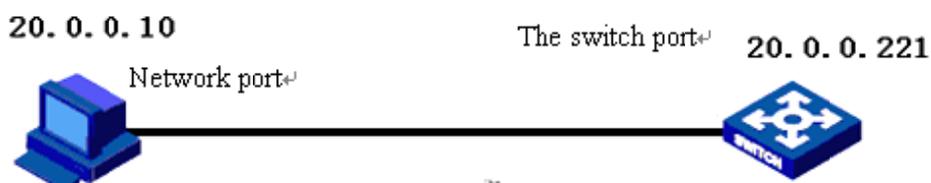

Step	Command	Description
1	config	Enter configuration mode
2	interface ip 0	Enter IP port mode
3	ip address A.B.C.D [A.B.C.D] <1-4094>	Configure the IP address of the switch A.B.C.D: IP address [A.B.C.D]: subnet mask <1-4094>: vlan number
4	exit	Quit global configuration mode and enter privileged EXEC mode
5	snmp-server host A.B.C.D version 3 { noauthnopriv authnopriv } NAME [udpport <1-65535>] [bridge] [config] [interface] [rmon] [snmp] [ospf]	Configure SNMPv3 Trap the destination host A.B.C.D: IP address NAME: SNMPv3 team name <1-65535>: the UDP port number which the destination use to receive TRAP
6	snmp-server keepalive-trap interval <120-28800>	Set the interval time for the switch sending KEEPALIVE-TRAP to SNMP network administration station <120-28800>: the interval range, the unit is second
7	snmp-server keepalive-trap {enable/disable/pause}	Start, close, pause sending keep alive trap
8	exit	Return to privileged EXEC mode
9	show snmp config	Show basic SNMP configuration

3.3.4 Monitoring And Maintenance

Show is used to show switch the operation and configuration for maintenance and monitoring. To do this, the following **show** command is available:

Command	Description
show snmp config	Show the basic configuration of SNMP

3.3.5 An Example Of Typical Configuration

As is shown above, set the IP address as 20.0.0.10 first, then configure the SNMPv2c Trap destination host

address: add a **host_1** host address, username public, SNMP version v2c, all trap, set the interval time 500S of the switch sending **keepalive-trap** to SNMP network administration station, open **keepalive trap**, show basic SNMP information at last.

```
Raisecom#config
```

```
Raisecom(config)# int ip 0
```

```
Raisecom(config-ip)#ip address 20.0.0.10 1
```

```
Raisecom(config-ip)#exit
```

```
Raisecom(config)#snmp-server host 20.0.0.221 version 2c public
```

```
Raisecom(config)#snmp-server keepalive-trap interval 500
```

```
Raisecom(config)#snmp-server keepalive-trap enable
```

```
Raisecom(config)# show snmp config
```

3.4 Task Scheduling Function

3.4.1 The Introduction To Task Scheduling Function Principle

The function is to carry out certain command periodically and maintain the switch configuration function seasonally. By configuring time list a time attribution list could be found, including start time , periodically time and end time. There are two kinds of time attribution, one begins when the switch starts, which is relative time; the other is the normal time, including year, month, day and so on, which is absolute time.

3.4.2 Task Scheduling Configuration

1. Setting task schedule:

Step	Command	Description
1	config	Enter global configuration mode
2	schedule-list list-no start {up-time days time [every days time [stop days time]] date-time date time [every {day/week/days time} [stop date time]]}	<p>Add or modify sechedule-list table. The command set the beginning time and end time of scheduling task, and the cycling interval.</p> <p>list-no: the range of scheduling list number<0-99>;</p> <p>days time: from the start-up time start, it is relative time; input format days: <0-65535>, time: HH:MM:SS such as 3 3:2:1</p> <p>date time: the calculation of time is in accordance with the system data, it is absolute time; input format: MMM-DD-YYYY HH:MM:SS: like jan-1-2003 or 1-1-2003, the range of YYYY is from 1970 to 2199.</p>
3	command-string schedule-list list-no	<p>Add the commands that support schedule-list to the scheduling list.</p> <p>command-string: command string.</p> <p>list-no: list number range<0-99></p>

3.4.3 Monitoring And Maintaining

Command	Description
show schedule-list	Show schedule-list configuration

3.4.4 Typical Configuration

First, add a **schedule-list** table, **List number:** 1, the beginning time is Feb-2-2004 0:0:0 according to system date, and perform every six days, while the terminal time is Feb-2-2005. Then, add the commands that support **schedule-list** to schedule list, and show the **schedule-list** configuration at last.

```
Raisecom#config
```

```
Raisecom(config)#schedule-list 1 start date-time Feb-2-2004 0:0:0 every 6 0:0:0 stop Feb-2-2005 0:0:0
```

```
Raisecom(config)#storm-control dlf schedule-list 1
```

```
Raisecom(config)#exit
```

```
Raisecom# show schedule-list
```

3.5 Fault Location

3.5.1 Fault Location Principle

When anything abnormal happened in the system, fault location can be carried out by examining the facilities' running information, which includes the following contents:

- RAM using;
- port driver;
- process and stack state;
- port UP/DOWN statistics;
- the information needed for fault location.

3.5.2 Memory Show

Command	Description
show memory	Show the memory state

3.5.3 Port Driver Memory Pool Show

Command	Description
---------	-------------

show buffer [port <1-26>]	Show the port driver pool state; <1-26>: port range
----------------------------------	--

3.5.4 Port UP/DOWN History

Command	Description
show diags link-flap	Show the UP/DOWN statistics

3.5.5 Fault Location Information Summarize Show

Command	Description
show tech-support	Show the fault location information summarize .

This command shows the information summarize for fault location, including:

- version (**show version**)
- running configuration information (**show running-config**)
- current CPU utilization (**show cpu-utilization**)
- memory usage (**show memory**)
- port driver pool usage (**show buffer**)
- processes (**show processes**)
- files in flash (**dir**)
- current system time (**show clock**)
- interface port state (**show interface port**)
- interface port statistics (**show interface port statistics**)
- port UP/DOWN statistics (**show diags link-flap**)
- SNMP statistics (**show snmp statistics**)
- spanning-tree in general (**show spanning-tree**)
- vlan statistics (**show vlan static**)
- ARP (**show arp**)
- trunk (**show trunk**)
- TCP link state

3.6 Ping Diagnose Function

3.6.1 Ping Principle

Ping is the most frequently-used command for troubleshooting, which is usually used to test if the link between the two hosts works. **Ping** is carried out by ICMP ECHO messages usually. It is made of ICMP reply and questioning messages, and if the network works well a reply messages will be received.

Ping can also be carried out through other paths, such as UDP, TCP and SNMP. In general, almost all the requests/replies can be used to acquire reply time. Usually, the ways except ICMP ECHO is used to settle the problem that some routers' no response or low response priority leads to the wrong answering time.

3.6.2 Ping Configuration

Test if the remote host is accessible.

Step	Command	Description
1	config	Enter global configuration mode
2	interface ip 0	Enter ip port mode Configure the ip address on the switch
3	ip address A.B.C.D [A.B.C.D] <1-4094>	A.B.C.D IP address [A.B.C.D] subnet mask <1-4094> vlan number
4	exit	Exit global configuration mode and enter privileged EXEC mode
5	exit	Exit privileged EXEC mode
6	ping Ipaddress [count NumPktsRe] [size SizeofIcmpeChPkt] [waittime PktTimOut]	Test if the remote host is accessible <i>Ipaddress</i> : test the IP address A.B.C.D <i>NumPktsRe</i> : Number of packets to receive specify the package number before the ping program ends <1-65535> <i>SizeofIcmpeChPkt</i> : Size of icmp echo packet specify the size of the ICMP answering message<1-4096> <i>PktTimOut</i> : Packet timeout in seconds specify the time-out time of ping waiting for answer <1-100>, the unit is milliseconds

3.6.3 Typical Configuration Example

As is shown below, the host connects the switch with cable. User can confirm if the connection works through the command **ping**, while the switch is also able to transfer data to the host through **ping**.

1. Set the switch IP address as 20.0.0.10, the connection IP address as 10.168.0.221, the number of messages sent is 3, the message size is 100, waiting time 3. Because the destination IP address goes against the PC IP, the connection does not work.

```
Raisecom#config
```

```
Raisecom(config)# int ip 0
```

```
Raisecom(config-ip)#ip address 20.0.0.10 1
```

```
Raisecom(config-ip)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#ping 10.168.0.221 count 3 size 100 waittime 3
```

Type CTRL+C to abort.

Sending 3, 108-byte ICMP Echos to 10.168.0.221 , timeout is 3 seconds:

UUU

no answer from 10.168.0.221

Ping unsuccessfully

2. connect PC, the IP address is 20.0.0.221, set the switch IP 20.0.0.10, connect success will be shown.

Raisecom#**config**

Raisecom(config)# **int ip 0**

Raisecom(config-ip)#**ip address 20.0.0.10 1**

Raisecom(config-ip)#**exit**

Raisecom(config)#**exit**

Raisecom#**ping 20.0.0.10 count 3 size 100 waittime 3**

Type CTRL+C to abort.

Sending 3, 108-byte ICMP Echos to 20.0.0.221 , timeout is 3 seconds:

!!!

Success rate is 100 percent(3/3)

round-trip (ms) min/avg/max = 0/10/32

3.7 Tracerout Diagnose

3.7.1 Traceroute Principle

Traceroute, like **ping**, is a useful way of network management, which is use to find the route that the router s and lines that the message actually passes.

L3 Traceroute is carried out by sending a group of incremental TTL probe packets. Probe packets work in the form of UDP or ICMP Echo. If only TTL>0, or a ICMP will be returned per hop to the destination. From this message the RRT of per hop on the way to destination.

3.7.2 Traceroute Configuration

Before L3 Traceroute is used, the IP address and default gateway of the switch need configuration first.

Step	Command	Description
1	config	Enter global configuration mode
2	interface ip 0	Enter IP configuration mode
		Configure the IP address of the switch
3	ip address A.B.C.D [A.B.C.D] <1-4094>	A.B.C.D : IP address [A.B.C.D] : subnet mask <1-4094> : vlan number
4	exit	Quit global configuration mode and enter privileged EXEC mode
5	ip default-gateway A.B.C.D	Configure the default gateway

		<i>A.B.C.D</i> : gateway number
6	show int ip	Show IP configuration
7	show running	Show default gateway configuration
		traceRoute show the route to destination
		<i>A.B.C.D</i> : IP address
		<i>firstTTL</i> : initialize TTL value
		<i>maxTTL</i> : maximize TTL value
8	traceroute A.B.C.D [firstTTL <1-255>] [maxTTL <1-255>] [port <1-65535>] [waittime <1-60>] [count <1-10>]	<1-255>: TTL value range
		<1-65535>: Port number range
		<1-60>: waiting time range
		<1-10>: count value

3.7.3 Typical Configuration Example

Example: set the IP address as 10.0.0.8, default gateway 10.100.0.1, trace the route to 58.63.236.42(www.sina.com.cn)

```
Raisecom#config
```

```
Raisecom(config)# int ip 0
```

```
Raisecom(config-ip)#ip address 10.0.0.8 1
```

```
Raisecom(config-ip)#exit
```

```
Raisecom(config)#ip default-gateway 10.100.0.1
```

```
Raisecom(config)#exit
```

```
Raisecom#Tracing the route to 58.63.236.42
```

Type ctrl+c to abort.

```

 1  10.0.0.1  10 ms  10 ms  10 ms
 2  192.168.101.5  3 ms   3 ms  73 ms
 3  192.168.101.5  10 ms  10 ms  10 ms
 4  202.96.4.81  18 ms  16 ms  19 ms
 5  202.106.228.177  9 ms   5 ms  12 ms
 6  202.106.228.5  10 ms  8 ms   9 ms
 7  202.96.12.25  7 ms   8 ms   5 ms
 8  219.158.11.66  24 ms  20 ms  10 ms
 9  202.97.15.57  101 ms 101 ms 126 ms
10  202.97.60.185  218 ms 222 ms 205 ms
11  202.97.40.58  119 ms 112 ms 113 ms
12  219.136.246.134 118 ms 142 ms 131 ms
13  219.136.246.6  138 ms 135 ms 110 ms
14  58.63.232.46  103 ms 115 ms 105 ms
15  58.63.236.42  199 ms 205 ms 197 ms

```

Trace complete.

3.8 Telnetd

3.8.1 Telnetd Principle

Telnet is the standard protocol and main way of remote login, which offers the ability of working on the local machine for remote host. The telnetd module in ROS4.0 implements the function of telnet server, letting telnet remote client login the facility so that it could be logged in and managed by telnet client.

3.8.2 Telnet Default Configuration

Function	Default value
Telnet server up-ling limit	5
telnet server link physical port	All the ports

3.8.3 Telnetd Configuration

1. Close telnet configuration

Step	Command	Description
1	config	Enter global configuration mode
2	telnet-server close	Telnet server close
	terminal-telnet <1-5>	<1-5> end telnet dialog number
3	exit	Return to privileged EXEC mode
4	show telnet-server	Show current telnet server configuration

2. Set the telnet server linking upper-limit

Step	Command	Description
1	config	Enter global configuration mode
2	telnet-server max-session <0-5>	Set the telnet server linking upper-limit <0-5> linking number
		Set the available port of the telnet server
3	telnet-server accept <i>port-list</i> <i>(all{ 1-MAX_PORT_STR})</i>	<i>port-list</i> : port list All: all the ports MAX_PORT_STR: port upper limit
4	exit	Return to privileged EXEC mode
5	show telnet-server	Show the current configuration of the telnet server
6	Show information port	Show information port

3.8.4 Typical Configuration Example

Set the linking upper limit of the telnet server as 3, open the available ports of Telnet server and show the current configuration.

```
Raisecom#config
```

```
Raisecom(config)#telnet-server max-session 3
```

Set successfully

```
Raisecom(config)#telnet-server accept port 3
```

```
Raisecom(config)#exit
```

```
Raisecom#show telnet-server
```

Max session: 3

Accept port-list: 1-26

3.9 Watchdog Function

3.9.1 Watchdog Principle

By configuring the watchdog software, the system program going into endless loop can be avoided, and the system stability will be better.

3.9.2 Configure Watchdog

Enable and Disable watchdog

Step	Command	Description
1	watchdog {enable/disable}	Enable: open watchdog
		Disable: close watchdog
2	show watchdog	Show watchdog state

3.9.3 Typical Configuration Example

Open watchdog and show the state

```
Raisecom#watchdog enable
```

Set successfully

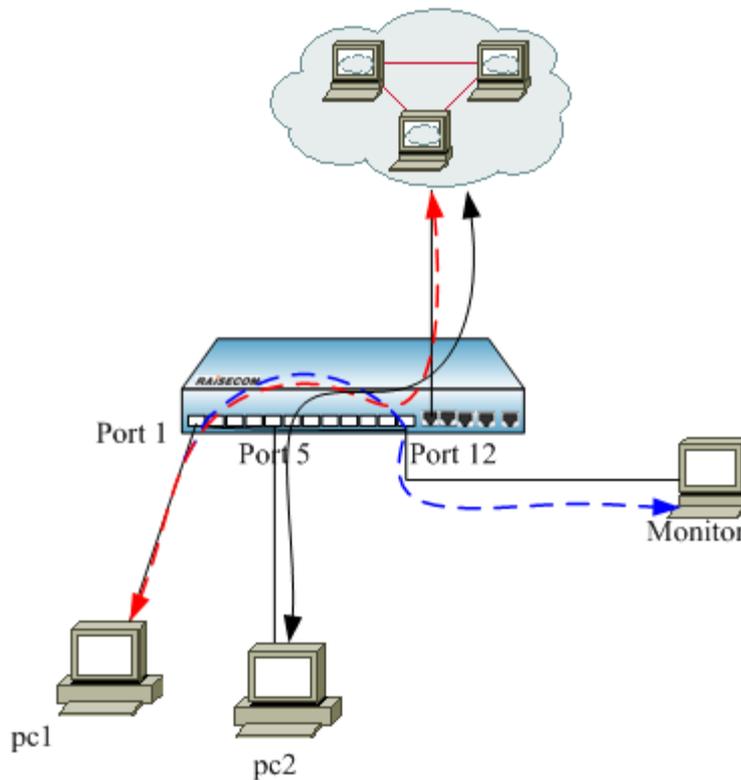

```
Raisecom#show watchdog
```

Watchdog function: Enable

Chapter 4 Mirroring

4.1 Local Port Mirror Function Principle

Mirror function is to copy some messages the appointed destination port from the appointed source port, while the normal message transmission works well. With this function, exchange equipment user can monitor the message delivering and receiving of a certain port, and analyse the network situation or defaults.

Mirror Function

Consult 1-1 as the principle.

PC1 and PC2 connect internet through port 1 and port 5 of the exchange equipment. When we need to monitor the data from PC1, we need to appoint the port 1 of the facility on connection as the mirror source port, and enable the mirror function of the receiving port message, then appoint monitoring port 12 as the destination port. When the data message from PC1 enters the exchange equipment, it will transfer the message and copy the message to the mirroring destination port (port 12). The monitoring equipment connected with the mirror destination port can receive the messages that is mirrored and make analysis.

4.2 Local Port Mirror Function Configuration

4.2.1 The Default Configuration

Function	Default value
Port mirroring	Disable
Mirror source port	Example
Mirror destination port	Port 1

4.2.2 Local Port Mirroring Function configuration

The traffic of source port will be copied to monitor port, so that network administrators can analyze the network.. Port 1 is monitor port by default, the source port and the monitor can not be same port.

When the mirror function go into effect, the message from I/O mirror ports will be copied to the monitoring port. The mirroring rules are set when the mirror ports are configured: both, ingress and/or egress. Also, the port can not be set as mirror port when it has already been set as monitoring port.

Only after the mirror function is enabled can the other configurations go into effect.

Step	Command	Description
1	config	Enter global configuration mode
2	mirror { enable disable }	Enable/disable the mirror function
3	mirror monitor-port <i>port_number</i>	Set the monitor port. <i>port_number</i> is physical port number, range is 1-26.
4	mirror source-port-list { both <i>port-list</i> / ingress <i>port-list</i> / egress <i>port-list</i> / ingress <i>port-list</i> egress <i>port-list</i> }	Set source port list, and appoint the corresponding ingress/egress <i>port-list</i> is the physical port list, use ',' and '-' to carry out multi-port input.
5	exit	Quit global configuration mode and enter privileged EXEC mode.
6	show mirror	Show mirror configuration

Notice:

- The mirroring messages also need to comply the VLAN configuration transmission rules of the port.
- There can be more than one mirroring port, but only one monitoring port is allowed. Mirror function is disabled by default.

With configuration command **no mirror source-port-list**, the mirroring port that has been configured can be deleted.

With configuration command **no mirror all**, all the mirroring configuration can be deleted.

4.2.3 Monitoring And Maintaining

The command to show the port mirroring function

Command	Description
show mirror	Show the port mirroring function

4.2.4 Typical Configuration Example

Set port 26 as the monitoring port, **ingress** port 5-8, **egress** port 7-12

```
Raisecom #config
```

```
Raisecom (config)#mirror enable
```

```
Raisecom (config)#mirror monitor-port 26
```

```
Raisecom (config)#mirror source-port-list ingress 5-8 egress 7-12
```

```
Raisecom (config)#exit
```

```
Raisecom #show mirror
```

```
Mirror: Enable
```

```
Monitor port: 26
```

```
-----the ingress mirror rule-----
```

```
Mirrored ports: 5-8
```

```
-----the egress mirror rule-----
```

```
Mirrored ports: 7-12
```

4.3 Mirroring Data Control Function

4.3.1 Mirroring Data Control Default Configuration

Function	Default value
Mirror destination port halting the not-mirroring data	Disable
Mirror source port ingress message split-flow number	1
Mirror source port ingress message filter source MAC address	0000.0000.0000
Mirror source port ingress filter destination MAC address	0000.0000.0000
Mirror source port egress message split-flow number	1
Mirror source port egress message filter source MAC address	0000.0000.0000
Mirror source port egress message filter destination MAC address	0000.0000.0000

4.3.2 Mirror Data Control Configuration

With the following commands, the mirror data can be within transmission control:

Step	Command	Description
1	config	Enter global mode
2(optical)	mirror block-non-mirror [enable/disable]	Configure the mirror destination port to enable/disable the filter function for the not-mirror messages
3(optical)	mirror [ingress/egress] divider <1-1023>	Configure after how many messages a packet is sent to the mirror pot from the source mirror ports' mirror data

4(optical)	mirror [<i>ingress</i> <i>egress</i>] <i>filter</i> <i>{source destination}</i> <i>HHHH.HHHH.HHHH</i>	For the source mirror port, configure to which MAC address the mirror function is closed
5	exit	Quit global configuration mode and enter privileged EXEC mode
6	show mirror	Show mirror configuration

Notice:

These commands are all configured in global configuration mode, and once the configuration is carried out it will affect all the source ports and destination ports.

The source and destination filter can configure only one MAC address.

4.3.3 Monitoring And Maintaining

Show the commands of mirror function

Command	Description
show mirror	Show mirror configuration

4.3.4 Typical Configuration Example

To figure 1-1, if there is too many data messages for port 1 to receive, and reducing the packets number for the monitoring facility is needed, it is supposed to do the following configuration:

Raisecom **#config**

Raisecom (config)**#mirror enable**

Raisecom (config)**#mirror monitor-port 12**

Raisecom (config)**#mirror source-port-list ingress 1**

Raisecom (config)**# mirror ingress divider 200**

Raisecom (config)**#exit**

Raisecom **#show mirror**

Mirror: enable

Monitor port: 12

Non-mirror port: Not block

-----the ingress mirror rule-----

Mirrored ports: 1

Filter rule: All

Divider: 200

MAC address: 0000.0000.0000

-----the egress mirror rule-----

Mirrored ports: --

Filter rule: All

Divider: 1

MAC address: 0000.0000.0000

4.4 VLAN Stream Mirror Function

Function	Default value
VLAN mirror port list	Empty
VLAN mirror VLANlist	Empty

4.4.1 Configure VLAN Stream Mirror Function

VLAN included in the VLAN stream mirror VLAN list, can be mirrored to the monitoring port if the entrance to the switch exists in the VLAN stream mirror port list.

Step	Command	Description
1	config	Enter global configuration mode
2	mirror source-vlan portlist <i>portlist</i>	Configure VLAN stream mirror port list <i>portlist</i> : port list. can make multi-port input through the connector ',' and '-'.
3	mirror source-vlan vlanlist <i>vlanlist</i>	Configure VLAN stream mirror VLAN list <i>vlan list</i> : VLAN list, can make multi-VLAN ID input through the connector ',' and '-'.
4	exit	Quit global configuration mode and enter privileged EXEC mode
5	show mirror	Show mirror configuration

Use **no** to clear up VLAN stream mirror port list, or **no mirror source-vlan portlist**.

Use **no** to clear up VLAN stream mirror VLAN list, or **no mirror source-vlan vlanlist**.

Notice:

- Use the same command to enable VLAN stream mirror function and enable local port mirror function.
- The same monitoring port is used for VLAN stream mirror function and local port stream mirroring function.
- The local port mirror command **no mirror all** is compatible, but when it is executed, VLAN stream mirror function is no longer valid.
- VLAN that has not been created can be added to VLAN stream mirror VLAN list, but will not be valid until it has been created and active.

4.4.2 Monitoring And Maintaining

Show the command of VLAN stream mirror function:

Command	Description
show mirror	Show mirror configuration

4.4.3 Typical Configuration Example

➤ Aim

Configure the monitoring port as 5, mirror the messages from VLAN 10, port 2 to the monitoring port.

➤ Configuration step

Step 1: enable mirror function, and configure monitoring port 5

```
Raisecom (config)#mirror enable
```

```
Raisecom (config)#mirror monitor-port 5
```

Step 2: configure VLAN stream mirror VLAN list

```
Raisecom (config)#mirror source-vlan vlanlist 10
```

Step 3: configure VLAN stream mirror port list

```
Raisecom (config)#mirror source-vlan portlist 2
```

Show the result:

```
Raisecom#show mirror
```

```
Mirror: Enable
```

```
Monitor port: 5
```

```
-----the ingress mirror rule-----
```

```
Mirrored ports: --
```

```
VlanMirrored ports: 10
```

```
VlanMirrored Vlan: 2
```

```
-----the egress mirror rule-----
```

```
Mirrored ports: --
```

Chapter 5 Rate Limiting & Shaping

5.1 Port rate limiting and shaping principle

Line rate means rate limiting based on ports, which restricts the overall rate of the ports' receiving and sending messages. Line rate uses token bucket to control the rate. If some port of the facility is in rate limit, all the messages received or sent by the port need to be handled by token bucket. If there is enough token in token bucket, then messages can be received or sent, or it will be abandoned.

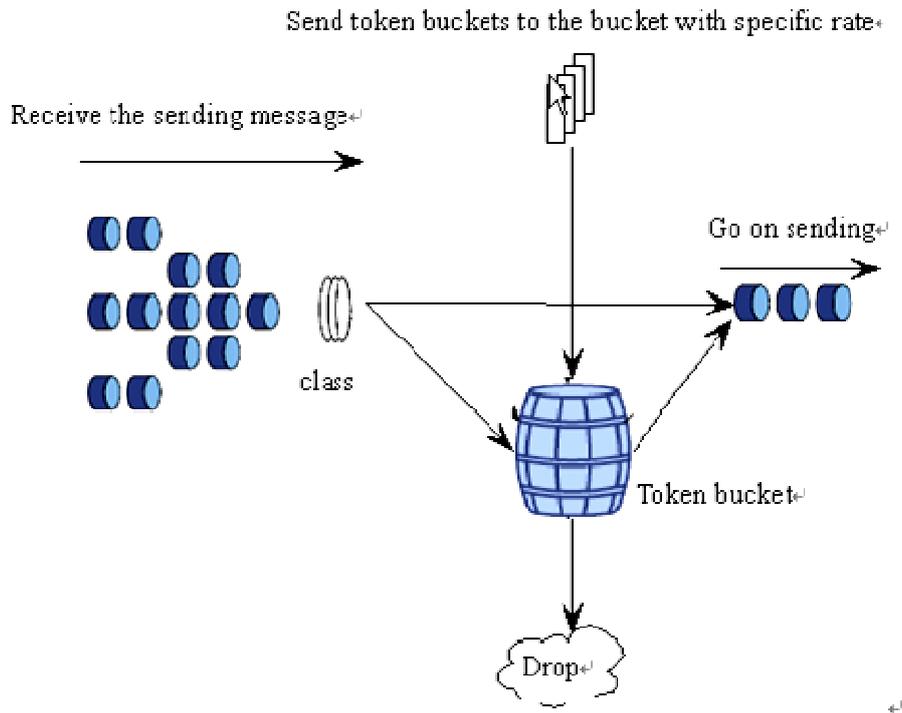

Fig-1 line rate process

Traffic shaping is used typically in confining the rate and limit of one stream in the output-network, so that this kind of message can be sent out steadily. Stream shaping is usually carried out by buffer and token bucket. When some groups' rate is too high, the message will be stored in buffer first, then it will be sent into the groups steadily.

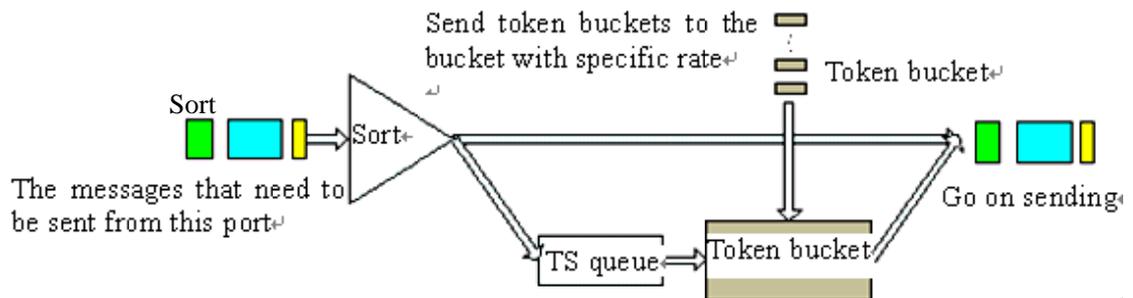

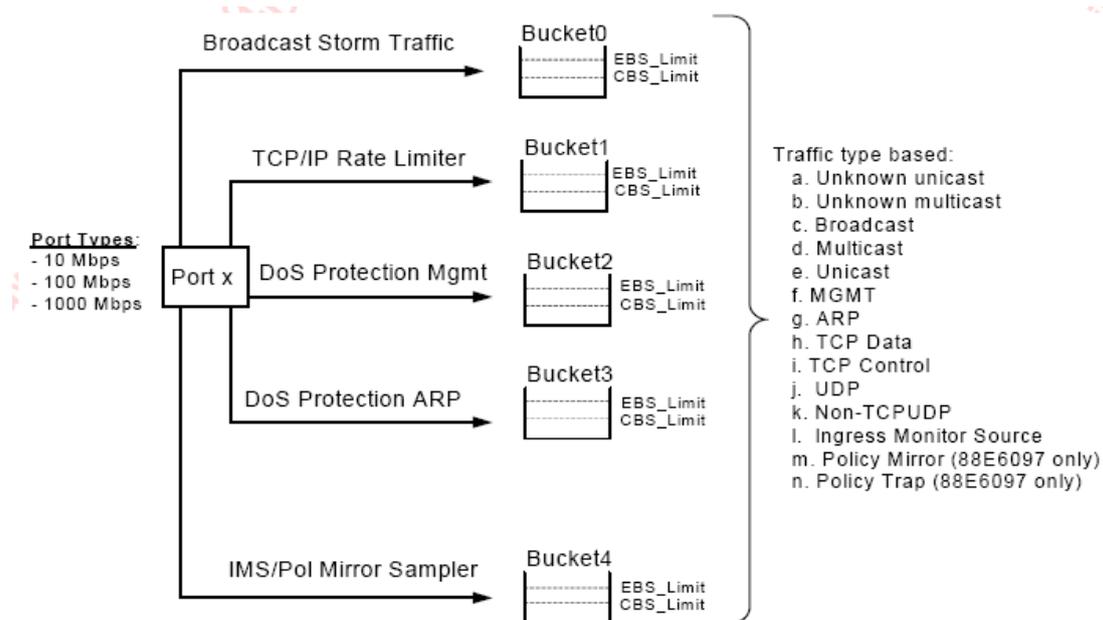

Figure 2 TS processing

TS can reshape given group stream or all the groups. When the groups come, it is classified first, and then continue transmission if there is no need for TS and token bucket. If TS is needed, the group will be compared with the token in token bucket. The token bucket put token in the bucket according to the rate that users set. If there is enough token for sending, the group will be sent, while the token number decreases according to the group length. When the token is the bucket is not enough for sending, the group will be stored in TS line. When there is group in the TS line, TS pick up one group and send it out periodically. Each sending will be compared with the token in the token bucket, until the token is not enough for the group in the line being sent out or all the groups in the line have been sent out.

For some purpose the bandwidth of the ports or VLAN needs to be confined. In this situation the bandwidth function needs to be configured that the port or VLAN bandwidth be confined in a range, the data that is over the bandwidth will be abandoned. By default, the ports and VLAN rate is auto negotiated, which need not to be confined.

The ingress port rate can be confined based on specified message and line priority. PIRL module uses speed confining resources to accomplish speed confining, aiming at the message type, message line privilege of the ingress port. Take MV6097 for example, this chip support 5 speed limitation resource every port, which is seized by global storm control, ports' message type and line privilege. Rate limitation is carried out by token bucket.

The model is as the following:

The speed limitation steps include: 64Kbps-1Mbps, the step is 64Kbps; 1Mbps-100Mbps, the step is 1Mbps; 100Mbps-1000Mbps, the step is 10Mbps.

Speed limitation aims at the following message type: ARP, TCP Data, TCP Ctrl, UDP, Non-TCPUDP, the line priority is 4. When the messages transmission speed exceeds the limit value, it can be abandoned or under traffic control.

5.2 Speed limitation and reshaping based on port function configuration

5.2.1. The default configuration

Function	Default value
The ingress port resource speed limitation message type, line priority calculation.	Or calculation relationship
When ingress port resource exceed the given speed limit	Drop drop
MAC no-speed limitation	Disabled
Port no-speed limitation function based on smac, dmac	Disabled

5.2.2. Port speed limitation and reshaping function

1. configure the ingress port bandwidth and burst:

Step	Command	Description
1	config	Enter global configuration mode Set the physical port bandwidth limit <i>port-list</i> physical port, ranging from 1 to the maximum number, use ',' and '-' for multi-port input:
2	rate-limit port-list {all <i>port-list</i>} ingress rate [<i>burst</i>]	<i>rate</i> means the bandwidth, the unit is kbps, from 1 to 1048576. <i>burst</i> the burst, unit Kbps, can be set from 1 to 512. The actual value may be different from the value setting; <i>ingress</i> the ingress direction
3	exit	Quit global configuration mode and enter EXEC privileged mode
4	show rate-limit port-list [<i>port-list</i>]	Show port bandwidth limitation. <i>port-list</i> is accord with the meaning above.

What's special, the specified message and queue priority speed limitation can be set.

Step	Command	Description
1	config	Enter global configuration mode Configure the port number, speed limitation value and message queue priority;
2	rate-limit port-list <i>portlist</i> ingress <1-1000000> queue-priority {1-4}	<i>Portlist</i> is the physical port, the range is 1 to the maximum number, use ',' and '-' to carry out multi-port input; 1-1000000 is the ingress port bandwidth, the unit is kbps; 1-4 means queue priority.
3	rate-limit port-list <i>portlist</i> ingress <1-1000000>	Configure the speed configuration port and value; <i>Portlist</i> means the physical port, the range is 1 to max no.; use ',' and '-' to carry out multi-port input. 1-1000000: ingress port bandwidth, the unit is kbps;
4	rate-limit port-list <i>portlist</i> ingress <1-1000000> [arp] [tcp-data] [tcp-ctrl] [udp]	Configure the speed configuration port and value; <i>Portlist</i> means the physical port, the range is 1 to max no.;

	[non-udptcp]	use ‘,’ and ‘-‘ to carry out multi-port input. 1-1000000: ingress port bandwidth, the unit is kbps; arp: arp messages tcp-data: tcp data; message; tcp-ctr:tcp control message; udp: udp message; non-udptcp: includes IGMP, ICMP, GRE, IGRP, cisco, L2TP message;
5	rate-limit port-list <i>portlist</i> ingress <1-1000000> queue-priority { 1-4 } { and/or } [arp] [tcp-data] [tcp-ctrl] [udp] [non-udptcp]	Configure the speed configuration port and value; <i>Portlist</i> means the physical port, the range is 1 to max no.; use ‘,’ and ‘-‘ to carry out multi-port input. 1-1000000: ingress port bandwidth, the unit is kbps; <i>or</i> : calculation type; and calculation type: the ingress message; arp: arp message; tcp-data: tcp-data message; tcp-ctr: tcp control message; udp: udp message; non-udptcp: includes IGMP, ICMP, GRE, IGRP, cisco, L2TP message;
6	exit	Return to EXEC privileged mode;
7	show interface port <i>port_id</i> rate-limit	Show PIRL configuration information <i>port_id</i> port ID

Notice: PIRL (Port Ingress Rate Limiting) module confines the ingress port value in the following range: mega port <64-100000>kbps, giga port <64-100000>kbps; when the mega port configuration value exceeds 100000kbps, it will be set as 100000kbps. If there is no specified speed limitation message or message queue priority, all the messages will be limited. The configuration value might be different from the actual value, which is decided by the chip.

In PIRL module, when the speed limited message transmission speed exceeds the speed limitation, use **drop** and sending pause frame to handle it.

The configuration step is show as following:

Step	Command	Description
1	config	Enter global configuration mode; Enter Ethernet physical port mode;
2	interface port <1-MAX_PORT_NUM>	MAX_PORT_NUM the maximum port number that the equipment support;
3	[no] rate-limit flow-control	Configure flow-control mode, by default it is drop mode ;
4	exit	Return to EXEC privileged mode
5	show interface port <i>port_id</i> rate-limit	Show PIRL configuration information;

port id: port number

In PIRL mode, the specified MAC speed no-limitation is available only to the messages that has already entered the switch; if it fits the static MAC configuration, then there will be no such message speed limitation.

The configuration step is show as following:

Step	Command	Description
1	config	Enter global configuration mode Configure the static MAC no-speed limitation function;
2	mac-address-table static unicast <i>HHHH.HHHH.HHHH</i> vlan <i>vlan_id</i> port <i>port-number</i> none-rate-limit	<i>HHHH.HHHH.HHHH</i> static MAC address; Vlan id: VLAN ID, the range is 1~4094; <i>port-number</i> port number, the range is from 1to the maximum port number;
3	exit	Return to EXEC privileged mode
4	show mac-address-table static	Show MAC strategy configuration.

Open/close no-speed limit function based on **smac**, **dmac**, the configuration step is show below:

Step	Command	Description
1	config	Enter global configuration mode Enter Ethernet physical port mode;
2	interface port < <i>I-MAX_PORT_NUM</i> >	<i>I-MAX_PORT_NUM</i> the port range that the equipment supports
3	[no] rate-limit {smac/dmac} none-rate-limit	Configure the no-speed limit function based on smac,dmac ;
4	exit	Return to global configuration mode
5	show interface port <i>port_id</i> rate-limit	Show PIRL configuration information; <i>Port id</i> port ID

2. Configure the ingress port bandwidth and burst:

Step	Command	Description
1	config	Enter global configuration mode
2	rate-limit port-list { all <i>port-list</i> } egress rate [<i>burst</i>]	Configure the rate limiting. <i>port-list</i> physical port number, range is 1-26, use “,” and “-“ for multiple ports’ rate limiting. <i>rate</i> stands for the maximum bandwidth allowed to be transmitted, unit is kbps, range is 1-1048576. (The actual value may be a little bit different from the configured value because it can only be the exponential of 2). <i>burst</i> : the configured bandwidth. Unit is KBps, the

		available value is 1-512. <i>The real value can be different with the configured value.</i>
		<i>egress</i> : the out traffic
3	exit	Exit from global configuration mode and enter privileged EXEC mode.
4	show rate-limit port-list [<i>port-list</i>]	Show the rate limiting of the port <i>port-list</i> physical port number, range is 1-26, use “,” and “-“ for multiple ports configuration.

To delete port speed limitation, use global configuration command **norate-limit port-list {all/*port-list*} {both | ingress | egress}**

5.2.3. Monitoring and maintaining

Use **show** to look over the switch’s configuration and states of port speed limitation and PIRL function for the convenience of monitoring and maintaining. The relative command is show below:

Command	Description
show interface port <i>port_id</i> rate-limit	Show PIRL configuration
show mac-address-table static	Show MAC strategy configuration
show rate-limit port-list [<i>port-list</i>]	Show the port bandwidth limitation <i>port-list</i> strands for physical port number, range is 1-26, use ‘,’ and ‘-‘ for multi-port ingress

5.2.4. Typical configuration example

➤ Aim

Configure the uplink bandwidth of the sw1’s port 1 as 1000kbps, burst 64kbps, port 2 fits message **arp** and speed limit at message priority level 1-2, the speed limit value is 1000Kbps, open port 2 traffic control mode, so that the switch could manage the network traffic.

➤ Network structure:

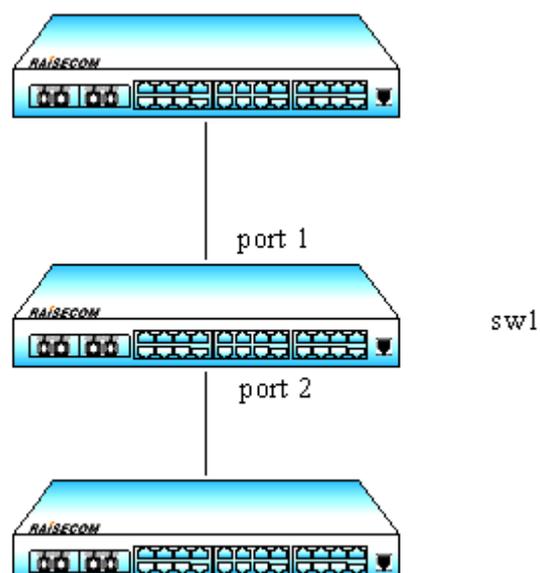

Figure 4 network structure

➤ Configuration step:

Step 1:

Raisecom#**config**

Raisecom(config)# **rate-limit port-list 1 ingress 1000 64**

Set successfully

Actual ingress rate of FE port: 1000

Actual ingress burst of FE port: 64

Raisecom(config)#**exit**

Raisecom# **show rate-limit port-list 1**

5.3 Speed limitation and reshaping function based on VLAN configuration

5.3.1. The default configuration

By default, there is no bandwidth limit based on VLAN.

5.3.2. Speed limitation and reshaping function based on VLAN configuration

1. Configure speed limitation based on VLAN:

Step	Command	Description
1	config	Enter global configuration mode Set the traffic limitation based on VLAN. <i><1-4094>:VLANID;</i>
2	rate-limit vlan <i><1-4094> rate burst</i>	<i>Rate</i> strands for the bandwidth limitation based on VLAN, the unit is kbps, range is 1-1048576. The actual value may be different from the configured one. <i>burst</i> configured burst, the unit is Kbps,
3	exit	Exit from global configuration and enter EXEC privileged mode
4	show rate-limit vlan	Show the port speed limitation

2. configure the bandwidth and burst based on QinQ VLAN

Step	Command	Description
1	config	Enter global configuration mode Configure the bandwidth limit based on QinQ VLAN; outer {<1-4094> any} outer layer VLAN, any strands for any outer layer VLAN;
2	rate-limit double-tagging-vlan outer {<1-4094> any} inner {<1-4094> any} <i>rate burst</i>	inner {<1-4094> any} lining VLAN, any strands for any outer layer VLAN; <i>rate</i> strands for the configured bandwidth value, the unit is kbps, range is 1-1048576, the actual value may be different from the configured value. <i>burst</i> the configured burst, the unit is kbps, the value can be set from 1 to 512. The actual value may be different from the configured value.
3	exit	Exit from global configuration mode and enter EXEC privileged mode.
4	show rate-limit vlan	Show the port bandwidth limitation.

Notice: The outer layer VLAN can not be un-assigned at the same time.

5.3.3. Monitoring and maintaining

Using **show**, the switch's VLAN speed limit configuration and state can be shown for the convenience of

monitoring and maintaining. The related command is shown below:

Command	Description
show rate-limit vlan	Show the port bandwidth limitation.

5.3.4. Typical configuration example

➤ Aim

Set the switch's VLAN 5 bandwidth as 2048kbps, the burst is 128kbps;

Set the outer layer VLAN as 6, lining VLAN as 10, the bandwidth 1024kbps, the burst 64kbps, to accomplish VLAN management.

➤ Configuration step:

Step 1:

Raisecom#**config**

Raisecom(config)# **rate-limit vlan 5 2048 128**

Set successfully

Actual rate: 2048

Actual burs: 128

Step 2:

Raisecom(config)# **rate-limit double-tagging-vlan outer 6 inner 10 1024 64**

Set successfully

Actual rate: 1024

Actual burs: 64

Raisecom(config)#**exit**

Raisecom# **show rate-limit vlan**

CVLAN: Customer VLAN(inner VLAN)

SPVLAN:Service provider VLAN(outer VLAN)

Type	CVLAN	SPVLAN	Rate(Kbps)	Burst(KBps)
single	5	--	2048	128
double	10	6	1024	64

Chapter 6 MAC Address Table

6.1 MAC transmission table management introduction

6.1.1 MAC address transmission table

The Ethernet switch's main function is to transmit message in data link layer, that is to transmit messages to the corresponding port according to the destination MAC address. MAC address transmission table is a two-ply table that contains MAC address and transmission port matchup, which is the base of the Ethernet switch transmitting two-ply messages.

MAC address transmission table contains the following information:

- The destination MAC address;
- The VLAN ID belongs to the port;
- The transmission egress port number of the local equipment;

When the Ethernet switch is transmitting messages, according to the MAC address table information, the following way is available:

- Unicast: when there is table item that fits the message destination MAC address in the MAC address transmission table, the switch will transmit it directly from the transmission egress port of the table item;
- Broadcast: when the messages that the switch received from the destination address are all F, or when there is no table item that is accord with the message destination MAC address in the MAC address transmission table, the switch will use broadcast and transmit the message to all the ports except the receive ports.

6.1.2 MAC address learning

The table item in MAC address table can be upgraded and maintained through the following two ways:

- Manual configuration
- MAC address learning

Usually, most MAC address is created and maintained by the MAC address function. The Ethernet switch learning MAC address process is shown below:

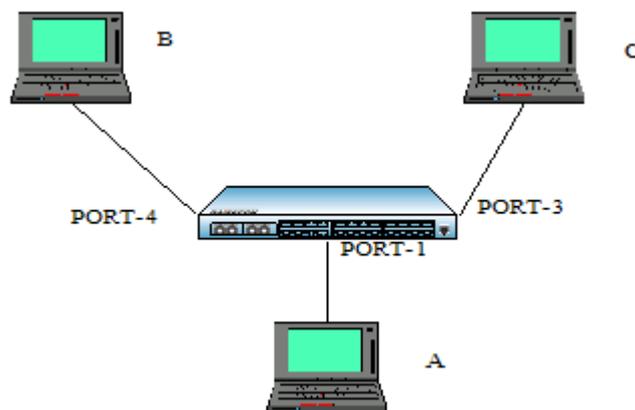

Fig 1 Mac address learning

When User A need to communicate with User B in the same VLAN1, the message need to be sent to the

switch's port 1, while the switch record the message's source MAC address, or User A's address 'MAC-A', to its own MAC address transmission table.

When the learning process is done, the switch will transmit the message. Because there is no MAC address and port table item, the switch will transmit the message to all the port except port 1 to confirm that User B could receive the message;

Because the switch use broadcast to transmit the message, both User B and User C will receive the message, while User C is not the destination equipment, so he will not process it. Normally, User B will respond User A by sending messages. When the response message is sent to port 4, the switch will use the same MAC address learning way and save User B's address and port corresponding relationship in the MAC address transmission table.

By this time there will be two table item in the switch's transmission table. When transmitting response message, because there has already been the table item that the destination is 'MAC-A' in the MAC address transmission table, the switch will no longer use broadcast, but send the message directly to User A through port 1 to accomplish the message interaction.

The way above is independent MAC address learning, or IVL, while there is another way for learning MAC address, that is share-VLAN MAC address learning, or SVL. By default, the switch use IVL mode, and SVL mode needs to be set in some cases.

6.1.3 MAC address table management

1. MAC address transmission table aging mechanism:

The switch MAC address transmission table has limitation in capacity, so it use aging mechanism to refresh the MAC address transmission table to make full use of the address transmission table resource. That is, the system open the aging timer when it is creating one table item dynamically, and if there is no more messages received from the MAC address of the table item in the aging time, the switch will delete the MAC address table item.

Notice:

- When 'destination MAC address refresh' function is enabled, if the switch transmits a message which the destination is one MAC address in the aging time, the MAC table item will be refreshed, and restart aging;
- MAC address aging mechanism is valid only to dynamic MAC address table item.

2. MAC address table sorts and features:

- Static MAC address table item: or 'permanent address', it is added or deleted by user, without aging. For a network in which the equipments change rarely, manually adding static address table item can reduce the network broadcast traffic.
- Dynamic MAC address table item: it stands for the MAC address table item that ages according to the aging time that user set. The switch could add dynamic MAC address table item through MAC address learning mechanism or user handwork.

6.2 MAC address transmission table management configuration

6.2.1 The default MAC address transmission table configuration

Function	Default value
----------	---------------

MAC address aging time	300s
MAC address learning feature	Enable
Static MAC address privilege	-1 (N/A in command lines)
Static MAC address MAC strategy	Transmit normally
Static MAC address no-speed-limit	enable

6.2.2 Static MAC address configuration

Step	Command	Description
1	config	Enter global configuration mode
2	mac-address-table static unicast <i>HHHH.HHHH.HHHH</i> vlan <i>vlan_id</i> port <i>port-number</i>	Set the static MAC address. <i>HHHH.HHHH.HHHH</i> is the static MAC address which will be set; format is hex, dotted notation for every four characters. Vlan_id range is 1-4094. <i>port_number</i> is the physical port number.
3	mac-address-table static multicast <i>HHHH.HHHH.HHHH</i> vlan <i>vlan_id</i> port <i>port-list</i>	Set the static MAC address. <i>HHHH.HHHH.HHHH</i> is the static MAC address which will be set; format is hex, dotted notation for every four characters. Vlan_id range is 1-4094. <i>port_number</i> is the physical port number, range is 1-26, use ',' or '-' to input the port list.
4	exit	Exit global configuration mode and enter privileged EXEC mode
5	show mac-address-table static [port <i>port-number</i> vlan <i>vlan_id</i>]	Show (port or VLAN) static address. <i>port_number</i> is physical port, range is 1-26. <i>vlan_id</i> : range is 1-4094.

Note: The switch MAC address, multicasting address, FFFF.FFFF.FFFF and 0000.0000.0000 can not be configured as the static MAC address.

6.2.3 MAC address aging time configuration

The dynamic source MAC address that the switch has learned will age when it is not in use. The aging time can be changed, and the MAC address aging can be disabled. By default, the aging time is 300s.

Step	Command	Description
1	config	Enter global configuration mode

		Set the aging time of MAC address table.
2	mac-address-table aging-time {0 time}	0 stands for MAC address will not be aged time is the target MAC address aging time, unit is second, range is 3-765, and default value is 300.
3	exit	Quit global configuration mode and enter privileged EXEC mode
4	show mac aging-time	Show MAC address aging time

To Restore the default value, use the command **no: no mac-address-table aging-time**.

6.2.4 MAC address learning enable/disable

Sometimes disable/enable a certain physical port learning MAC address is needed, which can be achieved by configuring the switch of MAC address learning ability. By default, every physical port can be allowed to learn MAC address.

Step	Command	Description
1	config	Enter global configuration mode.
2	mac-address-table learning {enable disable} port-list {all {1-26}}	Enable or disable the MAC address learning function of physical port. enable enable MAC address learning function. disable disable MAC address learning function. <i>MAX_PORT_NUM</i> the maximum port number that the equipment support
3	exit	Exit from global configuration mode to privileged EXEC mode.
4	show interface port [port-number]	Show port status. <i>port_number physical port, range is 1-26.</i>

6.2.5 Clear MAC address table

Clear layer-2 MAC address table entries of the switch, includes static and dynamic MAC address. The command can be used in global configuration mode.

Step	Command	Description
1	clear mac-address-table {all/dynamic/static}	all: delete all the 2 MAC addresses in the MAC address table dynamic: delete dynamic MAC addresses in the MAC address table static: delete static MAC addresses in the MAC address table

6.2.6 Configure static MAC address privilege

The static MAC address privilege value range is 0~7, the default value is -1, and the command line shows N/A when it is -1.

The configuration step is shown below:

Step	Command	Description
1	config	Enter global configuration mode Set static MAC address
2	mac-address-table static unicast <i>HHHH.HHHH.HHHH</i> vlan <i>vlan_id</i> port <i>port-number</i> [priority <0-7>]	<i>HHHH.HHHH.HHHH</i> is the static MAC address which will be set; format is hex, dotted notation for every four characters. <i>vlan_id</i> VLAN ID, range is 1~4094. <i>port-number</i> physical port number configure the privilege value, range is 0~7
3	exit	Quit global configuration mode and enter privileged EXEC mode.
4	show mac-address-table static [port <i>port-number</i> vlan <i>vlan_id</i>]	Show (port or VLAN) static address <i>port-number</i> physical port number <i>vlan_id</i> VLAN ID, range is 1~4094.

To restore static MAC address default privilege (-1), use **no: no mac-address-table static unicast HHHH.HHHH.HHHH vlan** *vlan id* **priority**.

6.2.7 enable/disable static MAC strategy

Static MAC address MAC strategy includes normal transmission (default), mirror and drop, all of which are based on port. This command enable global switches.

The step is shown below:

Step	Command	Description
1	config	Enter global configuration mode Set static MAC configuration
2	mac-address-table static unicast <i>HHHH.HHHH.HHHH</i> vlan <i>vlan_id</i> port <i>port-number</i> [mac-policy]	<i>HHHH.HHHH.HHHH</i> static MAC address which is to be set, format is hex, dotted notation for every four characters. <i>vlan_id</i> VLAN ID, range is 1~4094. <i>port-number</i> physical port number mac-policy enable MAC strategy.
3	exit	Quit global configuration mode and enter privileged EXEC mode.
4	show mac-address-table static [port <i>port-number</i> vlan <i>vlan_id</i>]	Show (port or VLAN) static address <i>port-number</i> physical port number <i>vlan_id</i> VLAN ID, range is 1~4094.

To close static MAC address MAC strategy default configuration, use **no: no mac-address-table static unicast HHHH.HHHH.HHHH vlan** *vlan id* **mac-policy**.

6.2.8 Enable/disable static MAC address non-rate-limit

Static MAC address can be set non-rate-limit. To the given MAC address, with non-speed-limit configuration, the messages into the MAC address have no speed limit.

Step	Command	Description
1	config	Enter global configuration mode Set static MAC configuration
2	mac-address-table static unicast <i>HHHH.HHHH.HHHH</i> vlan <i>vlan_id</i> port <i>port-number</i> [non-rate-limit]	<i>HHHH.HHHH.HHHH</i> static MAC address which is to be set, format is hex, dotted notation for every four characters. <i>vlan_id</i> VLAN ID, range is 1~4094. <i>port-number</i> physical port number non-rate-limit non-rate-limit feature
3	exit	Quit global configuration mode and enter privileged EXEC mode
4	show mac-address-table static [port <i>port-number</i> vlan <i>vlan_id</i>]	Show (port or VLAN) static address <i>port-number</i> physical port number <i>vlan_id</i> VLAN ID, range is 1~4094.

To close static MAC address non-rate-limit, use **no: no mac-address-table static unicast**
HHHH.HHHH.HHHH.HHHH **vlan** *vlan_id* **non-rate-limit**

6.2.9 Monitoring and maintaining

Use **show** to look over MAC address transmission table configuration:

Command	Description
show mac aging-time	Show MAC address aging time
show mac-address-table l2-address port <i>port-number</i>	Show the switch port MAC address <i>Port-number</i> physical port, range is 1~26
show mac-address-table l2-address vlan <i>vlan_id</i>	Show the switch port MAC address <i>vlan_id</i> VLAN ID, range is 1~4094
show mac-address-table l2-address count port <i>port-number</i>	Show the switch port MAC address number Count stands for the MAC address number related to the statistics <i>port-number</i> physical port number, range is 1~26.
show mac-address-table l2-address count vlan <i>vlan_id</i>	Show the switch VLAN MAC address Count stands for the MAC address number related to the statistics <i>vlan_id</i> VLAN ID, range is 1~4094
show mac-address-table static	Show the switch static MAC address configuration information
show mac-policy portlist <i>portlist</i>	Show the MAC strategy of each port

Especially, the command for searching the information of a certain MAC address in the switch.

Command	Description
	Search for MAC address
search mac-address <i>HHHH.HHHH.HHHH</i>	static MAC address which is to be set, format is hex, dotted notation for every four characters.

6.2.10 Typical configuration example

➤ Destination:

Enable all the ports' MAC address learning function of the switch;

Configure a static unicast MAC address 1234.1234.1234 in port 2, VLAN 10;

Set the aging time 100s, observe the switch MAC address learning and aging situation.

➤ Network figure

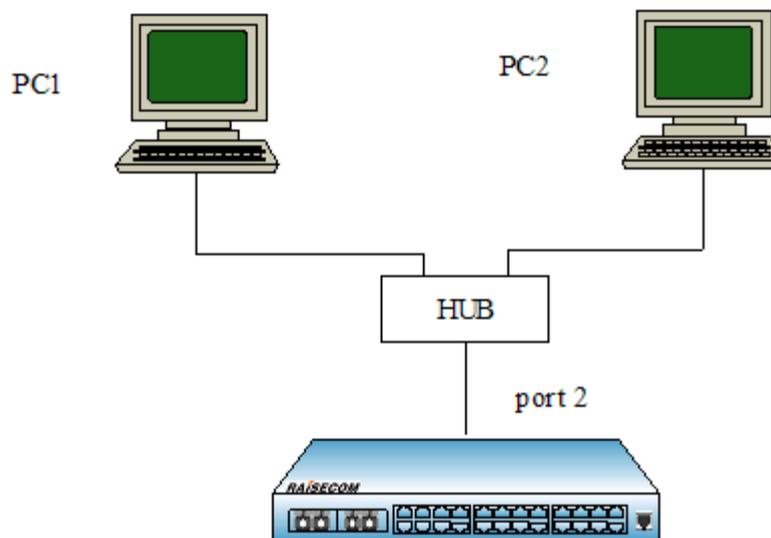

Fig 2 network

➤ Configuration step

Step 1:

Enable all the ports' MAC address learning function

Raisecom(config)#**mac-address-table learning enable port-list all**

Step 2:

Set static unicast MAC address 1234.1234.1234.1234 in port 2, VLAN 10

Raisecom(config)#**interface port 2**

Raisecom(config-port)#**switchport access vlan 10**

Raisecom(config)#**mac-address-table static unicast 1234.1234.1234 vlan 10 port 2**

Step 3:

Set the aging time as 100s

Raisecom(config)#**mac-address-table aging-time 100**

We can notice that the switch can learn 2 dynamic MAC address through port 2, which age 100s later, then restart learning, while static MAC address will no age.

6.3 MAC address number limit

With MAC address learning function, the Ethernet switch can get the MAC address within the same network segment. To the message that is sent to the MAC addresses, the Ethernet switch use hardware for transmission through looking for MAC address transmission table to raise the transmission efficiency. If the MAC address transmission table is much too large, the time of looking for the corresponding transmission table item may be prolonged, and the switch transmission function will drop. By configuring the maximum MAC address number that the Ethernet port can learn, the administrator is able to control the MAC address transmission table item number that the Ethernet switch maintains. When the MAC address number that the port has learned rises to the maximum value that user set, the port will no longer learn MAC address.

6.3.1 Configure the default MAC address number limit

By default, the MAC address learning number has no upper limit.

6.3.2 Configure the MAC address number

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client} <1-MAX_PORT_NUM >	Enter Ethernet physical port mode
3	mac-address-table threshold < PORT_MAC_MIN_THRESHOLD_STR - PORT_MAC_MAX_THRESHOLD_STR >	Configure the MAC address learning upper limit <i>PORT_MAC_MIN_THRESHOLD_STR</i> value upper limit <i>PORT_MAC_MAX_THRESHOLD_STR</i> value lower limit
4	exit	Quit global configuration mode and enter privileged EXEC mode
5	show interface mac-address-table threshold	Show interface mac address table threshold value

6.3.3 Monitoring and maintaining

Command	Description
show interface mac-address-table threshold	Show interface MAC address table threshold value
Show mac-addr l2	Show interface MAC address number that has been learned

6.3.4 Typical configuration example

➤ Destination

Configure the MAC address learning threshold of the switch port as 1, and the switch won't learn the dynamic MAC address that extend the threshold value.

➤ Network

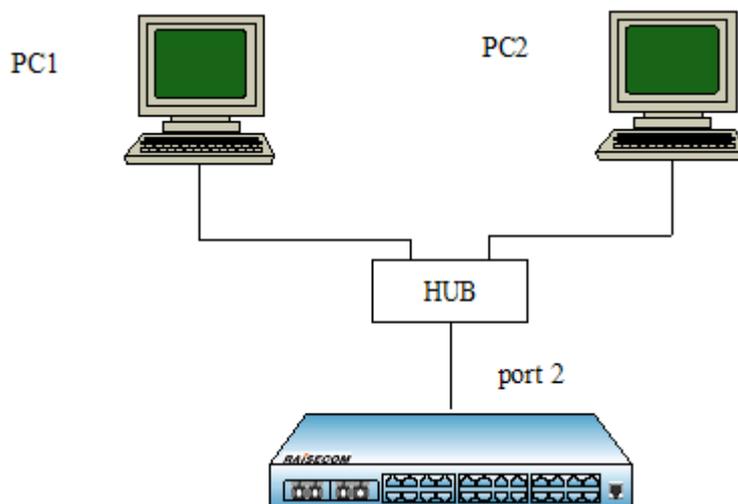

Fig 3 network

➤ Configuration step

Step 1:

The upper limit of port 2 learning MAC address is 100

```
Raisecom(config-port)#mac-address-table threshold 1
```

Step 2:

Show interface MAC address learning number:

```
Raisecom# show mac-address-table l2-address count port 1
```

Port 2 shows only 1 dynamic MAC is learned.

Step 3:

Cancel the MAC learning confirmation of port 2

```
Raisecom(config-port)#no mac-address-table threshold
```

Show interface MAC address learning number:

```
Raisecom# show mac-address-table l2-address count port 1
```

Port 2 shows there are 2 dynamic MAC that has been learned.

6.4 Shared VLAN learning function

6.4.1 The default SVL configuration

Function	Default value
SVL feature	Disabled
Interface SVL default VLAN list	Empty
SVL default VLAN	VLAN 1

6.4.2 SVL configuration

The step is shown below:

Step	Command	Description
1	config	Enter global configuration mode
2	svl { <i>enable</i> <i>disable</i> }	Enable/disable SVL mode
3	interface port <1-MAX_PORT_NUM>	Enter port configuration mode 1-MAX_PORT_NUM the port number that the equipment supports
4	switchport svl vlanlist {1-4094}	Optical Set the shared VLAN list of the port
5	exit	Enter global configuration mode
6	svl default vlan <1-4094>	Set SVL default VLAN 1-4094:VLAN ID
7	exit	Quit global configuration mode and enter privileged EXEC mode
8	show svl	Show SVL state
9	show switchport [<1-MAX_PORT_NUM>] svl vlanlist	Show interface shared VLAN list 1-MAX_PORT_NUM the port number that the equipment supports
10	show svl default vlan	Show SVL default VLAN

Notice: When some port is not configured the SVL VLAN list, the MAC will be shared to SVL default VLAN.

6.4.3 Monitoring and maintaining

Command	Description
Show svl	Show SVL state
show switchport [<1-MAX_PORT_NUM>] svl vlanlist	Show interface shared VLAN list 1-MAX_PORT_NUM the port number that the equipment supports
Show svl default vlan	Show SVL default VLAN

6.4.4 Typical configuration example

➤ Destination

Enable the switch SVL function, and share the MAC address learned in port 1 between VLAN 1-4;

➤ Configuration step

Step 1:

Enable SVL mode

Raisecom # **config**

Raisecom (config)# **svl enable**

Raisecom (config)# **exit**

Raisecom # **show svl**

SVL: Enable

Step 2:

Set port 1 shared VLAN 1-4

Raisecom#**config**

Raisecom(config)#**interface port 1**

Raisecom(config-port)# **switchport svl vlanlist 1-4**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom# **show switchport 1 svl vlanlist**

Port SVL VLAN list

Chapter 7 Port Rate

7.1 Physical ports features

For a switch, whatever the equipment is, physical interface is necessary for connection. And physical ports have many features, any message that is entering or leaving the switch needs physical ports to transmit, so the function of physical port is relatively more difficult, which is also very important; to some of the function manual configuration is available, like port rate, duplex mode, negotiation mode, crossover cable automatic recognition and system maximum transmission unit, all of which are the features of the physical ports. To the certain use, the corresponding setting is needed for the physical port to receive or transmit messages.

7.2 The default configuration for physical ports

By default, the physical port commands is shown below:

Command	Default value
Rate configuration	The rate of electronic port and 100M optical port is auto negotiated, 100M optical port rate is 100M by default
Duplex mode configuration	The rate of electronic port and 100M optical port is auto negotiated, 100M optical port in duplex is full duplex
Rate control configuration	Physical port rate control function is off
Crossover Ethernet cable auto-recognition and straight Ethernet cable function	Normal mode
Port maximum transmission unit	1522 byte
Interface on/off configuration	on

7.3 Rate and duplex mode configuration

Gigabit port is always working in 1000Mbps and full duplex mode. When auto negotiation function is enabled, the duplex mode (speed) will be set according to the result auto negotiation. In default situation, auto negotiation is enabled for all the electronic ports and 1000M optical port, only the default value of 100M optical port is 100M/FD.

Rate and duplex mode configuration step is shown below:

Step	Command	Description
1	config	Enter global configuration mode.
2	interface port <i>port-number</i> interface range <i>port-list</i>	Enter Ethernet physical interface configuration mode or physical interface range configuration mode. <i>port_number</i> is the physical interface, range is 1-26.

		<i>port-list</i> range is 1-26, use “,” and “-“for multiple interfaces configuration.
		Set the speed and duplex mode of the port. <i>auto</i> : represents that both the speed and duplex are set according to the result of auto negotiation.
3	speed { <i>auto</i> 10 100 1000} duplex { <i>full</i> <i>half</i> }	10: represents that the speed is set to 10Mbps. 100: represents that the speed is set to 100Mbps. 1000: represents that the speed is set to 1000Mbps. <i>full</i> : set the duplex mode to full duplex. <i>half</i> : set the duplex mode to half duplex.
4	exit	Exit from Ethernet physical interface configuration mode to global configuration mode.
5	exit	Exit from global configuration mode to privileged EXEC mode
6	show interface port <i>port-number</i>	Show the status for the port. <i>port_number</i> physical port, range is 1-26.

Note:

- Using the Ethernet interface configuration mode **speed auto**, the rate and duplex mode will be restored to auto negotiation by default.
- Different ports fit different rate and duplex mode. 100M electronic ports can not be set to 1000M, 100M optical port can be set to 100M/FD only, 1000M optical port can be only configured 1000M/FD/auto, while extended card port can not be configured rate and duplex mode when the extended card does not exist.

Example 1: set the speed of port 15 to 10Mbps, duplex mode is full duplex.

Raisecom#**config**

ISCOM2826(config)#**interface port 15**

ISCOM2826(config-port)#**speed 10**

ISCOM2826(config-port)# **duplex full**

ISCOM2826(config-port)#**exit**

ISCOM2826(config)#**exit**

Raisecom#**show interface port 15**

R: Receive Direction

S: Send Direction

<i>Port</i>	<i>Admin</i>	<i>Operate</i>	<i>Speed/Duplex</i>	<i>Flowcontrol(R/S)</i>	<i>Mac-learning</i>

15	enable	down	10/full	off/off	enable

Example 2: set the rate of 100M optical port to 10Mbps, duplex mode is half-duplex.

Raisecom#**config**

Raisecom(config)#**interface port 1**

Raisecom(config-port)#**speed 10**

Port 1 only supports 100M/FD!/ port1 support only 100M/FD!

Raisecom(config-port)# **duplex half**

Port 1 only supports 100M/FD!/ port1 support only 100M/FD!

Example 3: set 1000M optical port P2 to 100Mbps, duplex mode is half-duplex

Raisecom#**config**

Raisecom(config)#**interface port 2**

Raisecom(config-port)#**speed 100**

Port 2 only supports 1000M/FD or auto-negotiation!/ port 2 support only 100M/FD or auto negotiation.

Raisecom(config-port)# **duplex half**

Port 2 only supports 1000M/FD or auto-negotiation!/ port 2 support only 100M/FD or auto negotiation.

Example 4: set 100M electronic port P3 to 1000Mbps

Raisecom#**config**

Raisecom(config)#**interface port 3**

Raisecom(config-port)#**speed 1000**

Port 3 does not support 1000M!/port 3 do not support 1000M!

Example 5: set extended card P25 to 1000Mbps

Raisecom#**config**

Raisecom(config)#**interface port 25**

Raisecom(config-port)#**speed 1000**

Port 25 is unavailable!/ port 25 does not exist.

7.4 Configure IEEE 802.3X flow control function

The flow control function of Raisecom series switches is set on both RX and TX direction, that is to say, you can set the interface's ability to receive and send pause frame to on/off separately. By default, flow control function is disabled on both directions. For extended card port, if there is no corresponding extended card inserted, the flow control commands fail.

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <i>port-number</i> interface range <i>port-list</i>	Enter Ethernet physical interface configuration mode or range configuration mode. <i>port_number</i> physical ports, range is 1-26.

		<i>port-list</i> , range is 1-26, use “,” and “-“ for multiple ports.
		Enable/disable the flow control function on RX and TX direction.
		Send represents the traffic control function at TX direction.
3	flowcontrol <i>{receive send}{on off}</i>	<i>receive</i> : represents the traffic control function at RX direction. <i>on</i> : enable the flow control function of the port. <i>off</i> : disable the flow control function of the port.
4	exit	Exit from the physical interface configuration mode and enter global configuration mode.
5	exit	Exit from global configuration mode and enter privileged EXEC mode.
6	show interface port <i>port-number</i>	Show the traffic control of the port. <i>port_number</i> physical port number, range is 1-26.

Example 1: Set the flow control for port 10.

```
Raisecom#config
ISCOM2826(config)# interface port 10
ISCOM2826(config-port)#flowcontrol receive on
ISCOM2826(config-port)#exit
ISCOM2826(config)#exit
Raisecom#show interface port 10
```

R: RX Direction

S: tx Direction

<i>Port</i>	<i>Admin</i>	<i>Operate</i>	<i>Speed/Duplex</i>	<i>Flowcontrol(R/S)</i>	<i>Mac-learning</i>
10	enable	down	auto	on/off	enable

Example 2: set the extended card P25 flow control function on.

```
Raisecom#config
Raisecom(config)#interface port 25
Raisecom(config-port)# flowcontrol on
```

Port 25 is unavailable! /port 25 does not exist!

For some equipment, the flow control situation of the ports' receiving direction and sending direction is configured respectively. By default all the ports' flow control is off.

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <i>port-number</i>	Enter physical port mode or interface range

	interface range <i>port-list</i>	configuration mode. <i>port_number</i> physical port number, range is 1-26 <i>port-list</i> port list, range is 1-26, use ',' and '-' for multiple setting.
3	flowcontrol { <i>receive send</i> }{ <i>on off</i> }	Configure physical port flow control function on/off send strands for the flow control function of the sending direction; receive strands for flow control function of the receiving direction; on enable interface flow control function; off disable interface flow control function
4	exit	Quit physical port configuration mode and enter global configuration mode
5	exit	Quit global configuration mode and enter privileged EXEC mode
6	show interface port <i>port-number</i>	Show interface flow control state; <i>port_number</i> physical port number.

For example: set port 10 flow control function on receiving direction to on.

Raisecom#**config**

Raisecom(config)# **interface port 10**

Raisecom(config-port)#**flowcontrol receive on**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show interface port 10**

R: Receive Direction

S: Send Direction

```

Port Admin Operate      Speed/Duplex Flowcontrol(R/S) Mac-learning
-----
10   enable down         auto          on/off         enable

```

For some equipments, the flow control situation of the ports' receiving direction and sending direction is configured respectively, but the result take effect at the same time, that is to say, changing the flow control setting of any direction will effect the flow control configuration of both side, on or off at the same time. By default all the ports' flow control is off.

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <i>port-number</i> interface range <i>port-list</i>	Enter physical port mode or interface range configuration mode; <i>port_number</i> physical interface number; <i>port-list</i> port list, use ',' and '-' for multiple setting.

		Configure physical port flow control function on/off
		Send strands for the flow control function of the sending direction;
3	flowcontrol <i>{receive/send} {on/off}</i>	Receive strands for flow control function of the receiving direction;
		on enable flow control function
		Off disable port flow control function
4	exit	Quit physical port configuration mode and enter global configuration mode;
5	exit	Quit global configuration mode and enter privileged EXEC mode;
6	show interface port <i>port-number</i>	Show the port flow control state <i>port_number</i> physical port number.

For example: enable port 10 flow control function

Raisecom#**config**

Raisecom(config)# **interface port 10**

Raisecom(config-port)#**flowcontrol receive on**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show interface port 10**

R: Receive Direction

S: Send Direction

<i>Port</i>	<i>Admin</i>	<i>Operate</i>	<i>Speed/Duplex</i>	<i>Flowcontrol(R/S)</i>	<i>Mac-learning</i>

<i>10</i>	<i>enable</i>	<i>down</i>	<i>auto</i>	<i>on/on</i>	<i>enable</i>

7.5 Auto-MDIX function configuration

The function of Auto-MDIX is to auto-recognize crossover Ethernet cable and straight Ethernet cable. The configuration step is show below:

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <i>port-number</i> interface range <i>port-list</i>	Enter physical port mode or interface range configuration mode; <i>port_number</i> physical interface number; <i>port-list</i> port list, use ',' and '-' for multiple setting.
3	mdi (<i>auto normal across</i>)	Configure port MDI mode; auto linear ordering auto reserve mode normal normal mode

		across cross mode
4	exit	Quit physical port configuration mode and enter global configuration mode
5	exit	Quit global configuration mode and enter privileged EXEC mode
6	show mdi [<I-MAX_PORT_STR>]	Show port MDI state <I-MAX_PORT_STR>: physical port

For example: set port 8 Auto-MDIX function to auto mode.

Raisecom#**config**

Raisecom(config)# **interface port 8**

Raisecom(config-port)#**mdi auto**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show mdi 8**

Port 8 MDI mode :auto Current status :across

7.6 Line detection function

Line detection function is to detect the Ethernet port connection line, by which user can look over the state of the physical lines. The line information acquired from line detection module includes:

Detect line state:

Normal- line connection is normal

Open- circuit open

Shorted- circuit shorted

Error

Detect error position

The line sends error position

The line receives error position

Step	Command	Description
1	test cable-diagnostics port-list (<i>all portlist</i>)	Begin cable diagnoses. <i>all</i> all the physical ports <i>portlist</i> physical ports list
2	show cable-diagnostics port-list (<i>all portlist</i>)	Show cable diagnoses information <i>all</i> all the physical ports <i>portlist</i> physical ports list

For example: run cable diagnoses and show the result.

Raisecom#**test cable-diagnostics port-list all**

Raisecom#show cable-diagnostics port-list all

Port	Attribute	Time	RX Stat	RX Len(m)	TX Stat	TX Len(m)
1	Issued	01/01/2000 08:05:33	Open	1	Open	1

7.7 Maximum transmission unit configuration

Step	Command	Description
1	config	Enter global configuration mode
2	system mtu <1500-8000>	Set maximum transmission unit; <1500-8000> system maximum transmission unit range;
	no system mtu	Delete maximum transmission unit configuration
3	exit	Quit global configuration mode and enter privileged EXEC mode
4	show system mtu	Show system maximum transmission unit

For example: set system maximum transmission unit to 5000.

Raisecom#**config**

Raisecom(config)# **systemc mtu 5000**

Raisecom(config)#**exit**

Raisecom#**show system mtu**

System MTU size: 5000 bytes

7.8 Add description for interfaces

Description of the Physical port and IP port can be added.

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <i>port-number</i>	Enter physical layer port configuration mode or volume configuration mode <i>port_number</i> physical port number, range is 1-26
3	[no]description WORD	Add physical port or IP interface decription <i>WORD</i> —specify class-map decription. 255 character the most, can not be departed by space.
4	exit	Quit physical layer port configuration mode and enter global configuration mode.
5	exit	Quit global configuration mode and enter privileged EXEC mode.
6	show interface port [<1-MAXPORT>] detail	Show port information <1-MAXPORT> port number.

Example 1: add decription for physical port 20.

Raisecom#**config**

Raisecom(config)# **interface port 20**

Raisecom(config-port)# **description this-is-a-class-map**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show interface port 20 detail**

7.9 Open and close physical layer port

Sometimes, for a certain intention, to close physical ports is needed, and configuring the ports' on/off is necessary. By default all the ports are on. To extended card port, physical port on/off commands are invalid when the card is not inserted.

Step	Command	Description
------	---------	-------------

1	config	Enter global configuration
		Enter physical layer port configuration mode or volume configuration mode.
2	interface port <i>port-number</i> interface range <i>port-list</i>	<i>port_number</i> physical port number. <i>port-list</i> port list, use ',' and '-' to make multi-port input.
		Close or open physical port.
3	<i>{shutdown no shutdown}</i>	shutdown stands for closing physical port. no shutdown stands for opening physical port.
4	exit	Quit physical layer interface configuration mode and enter global configuration mode
5	exit	Quit global configuration mode and enter privileged EXEC mode.
6	show interface port <i>port-number</i>	Show port state <i>port_number</i> physical port number.

Example 1: close port 20.

```
Raisecom#config
Raisecom(config)# interface port 20
Raisecom(config-port)#shut down
Raisecom(config-port)#exit
Raisecom(config)#exit
Raisecom#show interface port 20
```

R: Receive Direction

S: Send Direction

<i>Port</i>	<i>Admin</i>	<i>Operate</i>	<i>Speed/Duplex</i>	<i>Flowcontrol(R/S)</i>	<i>Mac-learning</i>

<i>20</i>	<i>enable</i>	<i>down</i>	<i>auto</i>	<i>off/off</i>	<i>enable</i>

Example 2: close extended card port P25 (without extended card inserted)

```
Raisecom#config
Raisecom(config)#interface port 25
Raisecom(config-port)# shut down
Port 25 is unavailable!
```

7.10 Monitoring and maintaining

Use **show** to show port state.

Command	Description
show interface port <i>port-number</i>	Show port state <i>port_number</i> physical port number.
show interface port [<i><1-MAXPORT></i>] detail	Show port information. <i><1-MAXPORT></i> port number.

For example: show port 8 state.

Raisecom#**show interface port 8**

R: Receive Direction

S: Send Direction

<i>Port</i>	<i>Admin</i>	<i>Operate</i>	<i>Speed/Duplex</i>	<i>Flowcontrol(R/S)</i>	<i>Mac-learning</i>

8	<i>enable</i>	<i>down</i>	<i>auto</i>	<i>off/off</i>	<i>enable</i>

Chapter 8 Storm Control

8.1 Storm control introduction

A packet storm occurs when a large number of broadcast, unicast, or DLF packets are received on a port. Forwarding these packets can cause the network to slow down or to time out. Storm control is configured for the switch as a whole but operates on a per-port basis. By default, storm control is enabled.

8.2 The default configuration for storm control function

By default, storm control is enabled for unicast DLF packets, broadcast packets and multicast packets.

8.3 Storm control function configuration

8.3.1 Enable/disable storm control function

The configuration is to enable/disable storm control

Step	Command	Description
1	config	Global configuration mode Enable/disable broadcast packet, multicast packet and DLF packet
2	storm-control { <i>broadcast</i> / <i>multicast</i> / <i>dlf</i> / <i>all</i> } { <i>enable</i> / <i>disable</i> }	Broadcast DLF broadcast packet Multicast DLF multicast packet Dlf DLF packet All broadcast, multicast and DLF unicast packets.
3	exit	Quit global configuration mode and enter privileged EXEC mode
4	show storm-control	Show storm control state

8.3.2 Storm control number

Configure storm control threshold, unit is kbps (kbit per second).

Step	Command	Description
1	config	Enter global configuration mode Set storm control threshold.
2	storm-control bps <i>value</i>	Value stands for the kbit number that is allowed to pass per second, range can be found on the command manual.
3	exit	Quit global configuration mode and enter

		privileged EXEC mode.
4	show storm-control	Show storm control state.

Configure storm control threshold, unit is pps (packet per second).

Step	Command	Description
1	config	Enter global configuration mode Set storm control threshold.
2	storm-control pps <i>value</i>	Value the storm packet number that is allowed to pass per second, range is 0-262143.
3	exit	Quit global configuration mode and enter privileged EXEC mode.
4	show storm-control	Show storm control state.

Set storm control threshold for broadcast, multicast and DLF packets, unit is %

Step	Command	Description
1	config	Enter global configuration mode Set storm control threshold for broadcast, multicast and DLF packets, unit is %
2	storm-control ratio <1-100> [<0-512>]	1-100 the bandwidth proportion of the storm packet 0-512 burst value, unit is Kbps;
3	exit	Quit global configuration mode and enter privileged EXEC mode.
4	show storm-control	Show storm control state.

8.4 Monitoring and maintaining

Command	Description
show storm-control	Show storm control state

8.4 Typical configuration example

Example 1: disable storm control to broadcast packet

Raisecom#**config**

Raisecom(config)# **storm-control broadcast *disable***

Raisecom(config)#**exit**

Raisecom#**show storm-control**

Broadcast: Disable

Multicast: Enable

Unicast destination lookup failed(DLF): Enable

Threshold: 1024 pps

Example 2: set storm control threshold value to 200kbps

Raisecom#config

Raisecom(config)# **storm-control** bps 200

Raisecom(config)#**exit**

Raisecom#show storm-control

Broadcast: Disable

Multicast: Enable

Unicast destination lookup failed(DLF): Enable

Threshold: 200 Kbps

Example 3: set storm control threshold to 2000.

Raisecom#config

Raisecom(config)# **storm-control** bps 2000

Raisecom(config)#**exit**

Raisecom#show storm-control

Broadcast: Disable

Multicast: Enable

Unicast destination lookup failed(DLF): Enable

Threshold: 2000 pps

Chapter 9 Layer-2 Protocol Transparent Transmission

9.1 Layer-two protocol transparent transmission principle

QinQ offers a relatively simple layer-two VPN tunnel, by packaging outer layer VLAN Tag of user's private network message, so that the message is able to go through the operator's backbone network with layer-two Tag. Based on this, with layer-two protocol transparent transmission function, the layer-two protocol of the user's network can go through the operator's network, so that the same user network of the different places can run layer-two protocol in uniform.

Usually layer-two protocol transparent transmission is carried out by the operator's network edge switch. Transparent transmission function starts on the port that connect the operator's network edge switch and user network. The port exchange mode is access mode or dot1 q-tunnel mode, while the user switch port that is connected with it is trunk mode or hybrid mode. User network's layer-two protocol message, coming from the transparent transmission port, enters operator's network after being packaged by operator edge switch (message input interface). Then decapsulation will be done by the edge switch and the message will be transmitted to user network.

Transparent transmission function includes message packaging and decapsulation, the basic principle is shown below:

- Message encapsulation: in the message input side, the equipment will change the destination MAC address of layer-two protocol message from user network into special broadcast MAC address (default value 010E.05E00.0003). In operator network, the modified message will be transmitted in the user's VLAN as data message.
- Message decapsulation: in the message output side, the equipment will recognize the message that the destination MAC address is special broadcast MAC address (default value is 010E.5E00.0003), and revert the destination MAC address to the source destination MAC address of layer-two protocol message, then send the message to the given user network.

Layer-two protocol transparent transmission function can run with QinQ function or work respectively. But in actual, after the protocol message MAC address being modified, it still need to be covered with outer Tag to go through the operator network.

9.2 Layer-two protocol transparent transmission configuration

Layer-two transparent transmission configuration includes: transparent transmission protocol enable/disable, transparent transmission message destination MAC address, COS value, the specified VLAN, the specified output port, message lost limit and port off limit. Configuring specified VLAN can make the transparent transmission message be transmitted by the specified VLAN, not the input VLAN; configuring the specified output port, can make the transparent transmission message being transmitted by only the given output port.

9.2.1 Layer-two protocol transparent transmission default configuration

Function	Default value
Enable/disable protocol transparent transmission	Disable
Message destination MAC address	010E.5E00.0003
Message COS	5
Specified VLAN	No specified VLAN
Specified output port	No specified output port
Message package lost limit	No limit
Message port disabled limit	No limit

9.2.2 Layer-two protocol transparent transmission configuration

By the following step, transparent transmission message destination MAC address, message COS value, the specified output port and VLAN can be configured, and enable/disable layer-two protocol transparent transmission function is available.

Step	Command	Description
1	config	Enter global configuration mode
2	relay destination-address <i>HHHH.HHHH.HHHH</i>	Configure transparent transmission message destination MAC address, transparent transmission message destination MAC address must be broadcast address, and can not take 0x0180C2 or 010E.5E00.0003 as front
3 (optical)	relay cos <0-7>	Set transparent transmission COS value, range is 0-7
4	interface port <i>portid</i>	Enter Ethernet physical port mode
5	relay port <i>portid</i>	Set transparent transmission specified output port, range is 1-MAX port number.
6	relay vlan <1-4094>	Set transparent transmission message specified VLAN, range is 1-4094.
7	relay { <i>stp/dot1x/lacp/gmrp/gvrp/all</i> }	Enable/disable port layer-two transparent transmission function, all stands for all layer-two protocols that support transparent transmission.
8	exit	Return to global configuration mode
9	exit	Return to privileged EXEC mode
10	show relay	Show transparent transmission function configuration and state
11	write	Save current system configuration

No relay destination-address reverts transparent transmission message destination MAC address to default value, that is 010E.5E00.0003. **no relay cos** clears transparent transmission message specified VLAN, that is the not specified VLAN. **no relay** {*stp/dot1x/lacp/gmrp/gvrp/all*} closes layer-two protocol transparent transmission function.

Notice:

- Transparent transmission message input equipment and output equipment need to configure the

same transparent transmission message destination MAC address, that is to say, to cooperate with other manufacturers, it is needed to keep the equipment transparent transmission message destination MAC address to stay the same. Transparent transmission message destination MAC address must be broadcast address, and can not begin with 0x0180c2 or 0x010E5E, but can be set to 010E.5E00.0003.

- Transparent transmission message COS value range is 0-7. Usually, transparent transmission protocol message PRI should be higher than ordinary data message.
- Transparent transmission specified output port can be any port of the equipment (except source port). User needs to make sure port VLAN attribution correct by configuration, or the message transparent transmission will fail.
- Transparent transmission specified VLAN value range is 1-4094. If this VLAN has not been created, transparent transmission message real-time transmission fails. So, when configuring specified VLAN, it is necessary to create and enable the VLAN on the equipment.
- To start layer-two protocol transparent transmission, it is needed to disable the corresponding protocols. To enable STP transparent transmission, closing STP protocol is needed.
- On the same equipment, when both the protocol message input port and output port transparent transmission function is enabled, the destination MAC address of protocol message will not be modified.

9.2.3 Layer-two protocol transparent transmission speed limit configuration

To configure transparent transmission message lost threshold and port off threshold, follow the steps below:

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter Ethernet physical port mode
3	relay drop-threshold { <i>stp</i> <i>dot1x</i> <i>lcp</i> <i>gmrp</i> <i>gvrp</i> } <1-4096>	Set transparent transmission message lost threshold, value range is 1-4096 PDUs/sec.
4	relay shutdown-threshold { <i>stp</i> <i>dot1x</i> <i>lcp</i> <i>gmrp</i> <i>gvrp</i> } <1-4096>	Set transparent transmission message close threshold, value range is 1-4096 PDUs/sec.
5	exit	Return to global configuration mode
6	exit	Return to privileged EXEC mode
7	show relay	Show transparent transmission configuration and state
8	write	Save the current configuration of the system

No relay drop-threshold {*stp/dot1x/lcp/gmrp/gvrp*}: revert transparent transmission protocol packet lost default configuration. **no relay shutdown-threshold** {*stp/dot1x/lcp/gmrp/gvrp*}: revert transparent transmission protocol port close threshold to default configuration, use **no relay shutdown** to enable the port.

Notice:

- Transparent transmission message packet lost threshold and port close threshold value range is 1-40%, usually, packet lost threshold should be less than port close threshold.
- After port transparent transmission function is enabled, if message receiving rate exceeds port close threshold, or if the port receives the message of specified destination MAC address, the port will be closed. When the port is closed because of transparent transmission function, use **no relay shutdown** to enable the port.

9.2.4 Layer-two protocol transparent transmission message statistics clear

Follow the step below to clear transparent transmission message statistics

Step	Command	Description
1	config	Enter global configuration mode
2	clear relay statistics [port-list <i>port-list</i>]	Clear transparent transmission message stat. information
3	exit	Return to privileged EXEC mode
4	show relay statistics	Show transparent transmission stat. information.

9.2.5 Monitoring and maintaining

Command	Description
show relay [port-list <i>port-list</i>]	Show transparent transmission configuration and state
show relay statistics [port-list <i>port-list</i>]	Show transparent transmission message stat. information

9.2.6 Typical configuration example

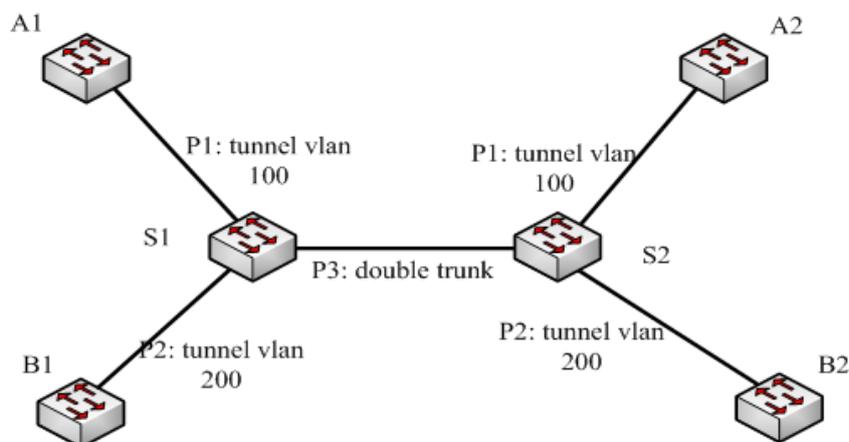

Fig 1 transparent transmission basic function configuration

S1,S2 configuration is the same. S1 configuration is shown below:

1) Create VLAN

```
Raisecom(config)#create vlan 100 active
```

```
Raisecom(config)#create vlan 200 active
```

2) Set port 1 exchange mode to dot1q-tunnel mode, ACCESS VLAN to 100, enable STP protocol transparent transmission and set STP message transparent transmission threshold to 1500.

```
Raisecom(config)# interface port 1
```

```
Raisecom(config-port)#switchport mode dot1q-tunnel
```

```
Raisecom(config-port)#switchport access vlan 100
```

Raisecom (config-port)#**relay stp**

Raisecom(config-port)#**relay drop-threshold stp 1500**

Raisecom (config-port)#**exit**

3) Set port 2 exchange mode to dot 1q-tunnel mode, ACCESS VLAN to 200, enable STP protocol transparent transmission and set STP message transparent transmission threshold to 1000.

Raisecom(config)# **interface port 2**

Raisecom(config-port)#**switchport mode dot1q-tunnel**

Raisecom(config-port)#**switchport access vlan 200**

Raisecom (config-port)#**relay stp**

Raisecom(config-port)#**relay drop-threshold stp 1000**

Raisecom (config-port)#**exit**

4) Set port 3 exchange mode to trunk double-tagging mode.

Raisecom(config)# **interface port 3**

Raisecom(config-port)# **switchport mode trunk double-tagging**

Raisecom (config-port)#**exit**

Chapter 10 Layer-3 Interface

This chapter gives an introduction to how to configure and maintain the switch layer-three port, which includes:

- ✧ There-layer interface introduction
- ✧ Layer-three interface configuration
- ✧ Monitoring and maintaining
- ✧ Typical configuration example
- ✧ Layer-three interface configuration debugging

10.1 Layer-three interface introduction

ISCOM switch layer-three interface is based on VLAN virtual interface configuration, which is for network facility management. To the VLAN that needs router function, a related virtual layer-three interface can be set for it. Layer-three interface shows as IP address, and every layer-three interface has a IP address and relate at least one VLAN.

10.2 Layer-three interface configuration

At present, to ISCOM two-layer switch, 15 virtual layer-three interfaces can be configured, range is 0-14; to ISCOM layer-three switch, 63 virtual layer-three interfaces can be configured, range is 0-62.

The process of creating layer-three interface and configuring IP address is shown below:

Step	Command	Description
1	config	Enter global configuration mode
2	Interface ip <0-ifNum>	Enter Ethernet layer-three interface configuration mode
3	ip address ip-address [ip-mask] vlanlist	Set layer-three interface IP address and related static VLAN ID

10.3 Monitoring and maintaining

In privileged EXEC mode, use **show interface ip** to show layer-three interface configuration state. By looking over the information shown, user can validate the configuration effect.

Command	Description
show interface ip <0-ifNum>	Show layer-three information

10.4 Typical configuration example

Set ISCOM switch IP interface 1 address to 20.0.1.4, subnet mask to 255.255.255.0, and relate VLAN 1.

```
Raisecom #config
```

```
Raisecom (config)#interface ip 1
```

```
Raisecom (config-ip)#ip address 20.0.1.4 255.255.255.0 1
```

10.5 Layer-three interface configuration debugging

Fault appearance: ISCOM switch can not connect the host by **ping**.

Debugging step:

Step 1: check out if the switch configuration is correct, use **show arp** to show if there is host ARP table unit in the ARP table.

Step 2: check out which VLAN the interface that connect the switch and the host belongs to, if the VLAN belongs to the IP interface that is configured, if the IP address and the host belong to the same network segment.

Step 3: if the configuration is correct, open ARP debugging on-off on the switch, and check out if the switch has sent and receive ARP message correctly. If there is only message sent out, while no message received, then there may be problem in Ethernet physical layer.

Chapter 11 Link Aggregation

11.1 Link aggregation function principle

Link aggregation is to combine several physical Ethernet port into a logical aggregation group. Use the upper class entity of link aggregation service to take the physical links in the same aggregation group as a logical link.

Link aggregation is able to make the aggregation member taking part in the out/in traffic to increase bandwidth. At the same time, the member ports of the same aggregation group will dynamically backup each other, which increases the connection stability.

This chapter, trunk configuration includes:

- Enable/disable link aggregation.
- Add/delete link aggregation group
- Set all the aggregation link load-sharing mode

11.2 Static aggregation function configuration

11.2.1 Static aggregation default configuration

Function	Default value
Link aggregation	On
Link aggregation group	Does not exist, manual configuration is needed
Load balancing mode	Source, destination MAC address logic OR result selects the transmission port

11.2.2 Configure static aggregation

11.2.2.1 Configure aggregation group and start link aggregation function

Follow the following step to configure link aggregation:

Step	Command	Description
1	config	Enter global configuration
2	trunk group <i>trunk-group-id portlist</i>	Add a aggregation group; trunk-group-id the created aggregation group number, range is 1-6; Portlist physical port number list, use ',' and '-' to do multi-interface input
3	trunk {enable/disable}	Enable/disable link aggregation
4	exit	Quit global configuration mode and enter

		privileged EXEC mode
5	show trunk	Show if link aggregation is on, link aggregation load balancing mode, the group member port configured by all the aggregation groups and the effective member port

Use **no trunk group** *trunk-group-id* to delete the specified aggregation group.

In the same aggregation group, all the member ports that are able to share output/input load must be of the same configuration, which includes STP, QoS, QinQ, VLAN, port attribution, MAC address learning, as is shown below:

Class	Contents
The same STP configuration	Port STP enable/disable state, link attribution that is connected with the port (port to port or not port to port), port path spending, STP priority, message sending out rate limit, configuring cycle protection or not, configuring root protection or not, edge port or not.
The same QoS configuration	Flow monitoring and shaping, jams avoidance, port traffic limit, SP line, WRR line attemperment.
The same QinQ configuration	Interface QinQ function on/off state, added outer layer VLAN Tag, the strategy of adding outer layer VLAN Tag that is different from inner layer VLAN ID.
The same VLAN configuration	The VLAN that is allowed to pass on the port, default VLAN ID of the port, the link type of the port (Trunk, Hybrid, Access), subnet VLAN configuration, protocol VLAN configuration, if there is Tag configuration in VLAN message.
The same port attribution	Whether to join isolate group, port rate, duplex mode, up/down state
The same MAC address learning configuration	Whether to own MAC address learning function, if the port has maximum learning MAC address limit, whether to continue transmitting and controlling when the MAC table is full.

11.2.2.2 Set load-sharing mode

Link aggregation has 6 load-sharing mode:

- **Smac** select transmission port according to source MAC address
- **Dmac** select transmission port according to destination MAC address
- **Axordmac** select transmission port according to source, destination MAC address logic OR result
- **Sip** select transmission port according to source IP address
- **Dip** select transmission port according to destination IP address
- **Sxordip** select transmission port according to source, destination IP address logic OR result

Step	Command	Description
1	config	Enter global configuration mode
2	trunk loading-sharing mode { <i>smac / dmac / sxordmac / sip / dip / sxordip</i> }	Configure all the link aggregation load-sharing mode
3	exit	Quit global configuration mode
4	show trunk	Show if link aggregation is on, link aggregation load-sharing mode, all the group

member port of the current aggregation group and the effective member port.

Use **no trunk loading-sharing mode** to revert link aggregation load-sharing default mode.

Notice: The command is supported by only a part of our equipments; follow the command manual for specific situation.

11.2.3 Monitoring and maintaining

Use **show** to look over link aggregation configuration

Command	Description
show trunk	Show if aggregation is enabled, link aggregation load-sharing balancing mode, all the group member port that is configured by aggregation group and the current effective member port.

Use **show trunk** to show if aggregation is enabled, link aggregation load-sharing balancing mode, all the group member port that is configured by aggregation group and the current effective member port. The current effective member port is the port list that the port state is UP in the configured group member ports. The example below is echo in the actual result:

Raisecom#**show trunk**

Trunk: Enable

Loading sharing mode: SXORDMAC

Loading sharing ticket algorithm: --

<i>Trunk Group</i>	<i>Member Ports</i>	<i>Efficient Ports</i>
3	1,4-6,8	1,4

11.2.4 Typical configuration example

11.2.4.1 Network requirement

SWA equipment use 4 ports aggregation to access SWB equipment, through which output/input load can be shared between the members. SWA access ports are port1~port 4.

11.2.4.2 Network structure

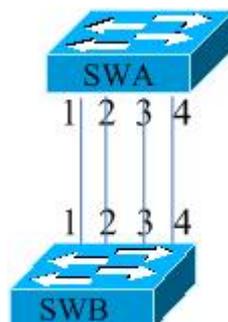

Fig 1 link aggregation network

11.2.4.3 Configuration step

Notice: The following steps list only the configuration to SWA; to SWB the same configuration is needed, so that link aggregation works.

1) Configure aggregation group, join the port into the aggregation group:

```
SWA#config
```

```
SWA(config)#trunk-group 1 1-4
```

```
SWA(config)#set successfully!
```

2) Configure the load-sharing mode of trunk link aggregation:

```
SWA(config)#trunk loading-sharing mode smac
```

```
SWA(config)#set successfully!
```

3) Enable link aggregation function:

```
SWA(config)#trunk enable
```

```
SWA(config)#set successfully!
```

```
SWA(config)#exit
```

```
SWA#show trunk
```

```
Trunk: Enable
```

```
Loading sharing mode: SMAC
```

```
Loading sharing ticket algorithm: --
```

<i>Trunk Group</i>	<i>Member Ports</i>	<i>Efficient Ports</i>

Chapter 12 STP

12.1 STP/RSTP principle introduction

12.1.1 STP purpose

STP (Spanning Tree Protocol) is founded according to 802.1D created by IEEE association, which is used for deleting data link layer physical loop protocol in local area network. The equipments that is running the protocol find loop in the network through exchanging message, and stop some ports selectively, then cut the loop network structure into tree network without any loop, which stop message breeding and looping endlessly, and avoid the host's message handling ability to decline because of receiving the same message.

STP has two meanings, narrowly-defined STP strands for the STP protocol defined in IEEE 802.1D, broadly-defined STP stands for the STP protocol defined in IEEE 802.1D and the modified spanning tree protocols based on it.

12.1.2 STP message

The protocol message STP uses is BPDU (Bridge Protocol Data Unit), which is also called configuration message.

STP transmits BPDU among equipments to make sure the network topology structure. There is enough information to make sure that the equipment finishes the spanning tree's computing.

BPDU is sorted into two types in STP:

- Configuration BPDU: the messages that is doing spanning tree computing and spanning tree topology maintenance.
- TCN BPDU (Topology Change Notification BPDU): the messages used for informing the related equipments network topology change when topology structure changes.

12.1.3 STP overview

1. root bridge

Root bridge is necessary for tree form network structure, so the concept of Root Bridge is taken into STP. There is only one root bridge all through the network, which changes according to network topology's change, so it is not stable.

After network convergence, the root bridge will create and send out configuration BPDU in accordance with a certain time interval, while the other equipments will transmit the configuration BPDU, to keep the topology stability.

2. root port

Root port means the port that is nearest to root bridge on a not-Root Bridge equipment, which sees to the communication to root bridge. There is only one root port on not-Root Bridge equipment, no root port on root bridge.

3. the designated bridge and port

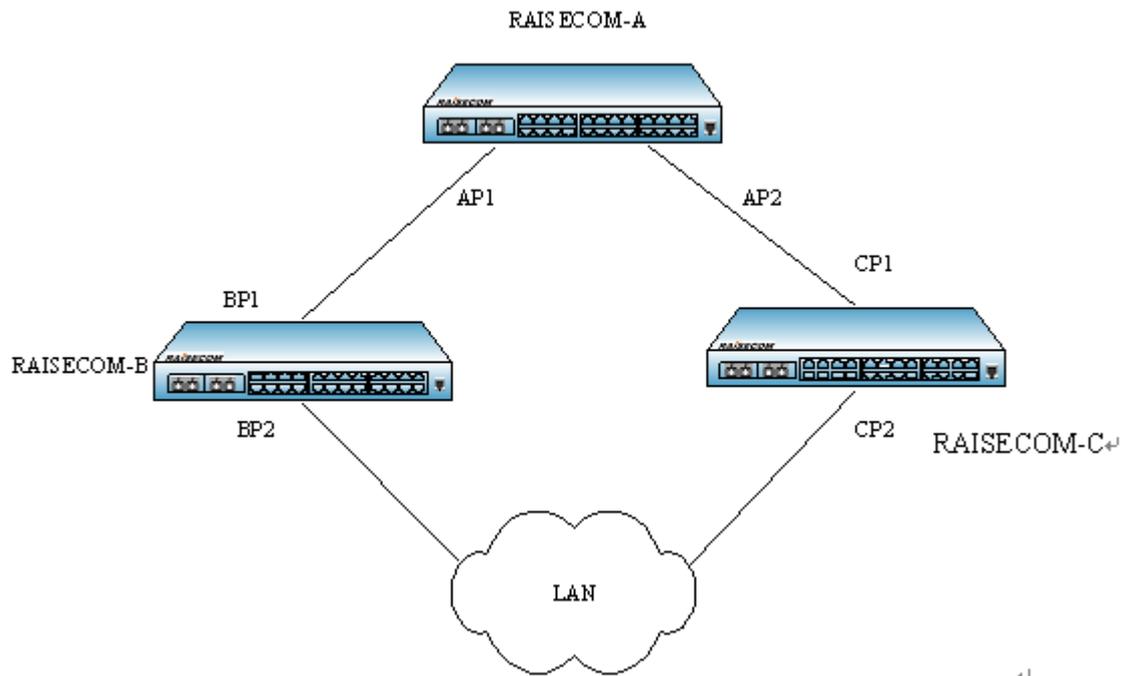

Fig 13-1: the designated bridge and port

The designated bridge and port is shown above, AP1, AP2, BP1, BP2, CP1, CP2 stands for the ports of Device A, Device B, Device C respectively.

Device A uses port AP1 to transmit configuration message to Device B, then the designated bridge of Device B is Device A, the designated port is AP1 of Device A.

There are two equipments that connect local area network: Device B and Device C. If Device B sees to transmitting configuration messages to LAN, the LAN designated bridge is Device B, the designated port is BP2 of Device B.

Notice: all the ports on root bridge are designated ports.

4. path cost

Path cost is the reference value for STP selecting links. By computing path cost, STP chooses the 'strong' link, jams the redundant links and cuts the network into tree form network structure without any loop.

12.1.4 STP basic principle

STP algorithm:

➤ Initialized state:

Each equipment will generate the BPDU message information that take itself as root bridge when it is initialized, the path cost is 0, designates bridge ID as the equipment its own ID, and designated port is the local port.

➤ Optimal allocation information selection:

Each equipment sends out its own configuration information, and receives the configuration information of the other equipments. The process when each port receives configuration information is shown below:

- When the configuration information the port received is lower in priority than its own one, the equipment will drop the information received, and take no action to the port's configuration information.
- When the configuration information the port received is higher in priority than its own one, the

equipment will replace the configuration information content of its own with the received configuration information content.

- Compare all the ports' configuration information and select the optimal configuration information.

Configuration information compare principle:

- The smaller ID configuration information has higher priority;
 - If root bridge ID is the same, compare the following configuration information priority and take the higher priority as the root bridge: the designed bridge ID, the designed port ID, the designed port ID, the port ID that receives the configuration information.
- Root bridge selection

When the network is initialized, all the STP equipments in the network will take themselves' root bridge, the root bridge ID is its own bridge ID. Through exchanging configuration information, the root bridge ID will be compared between the equipments, and the equipment that has the smallest root bridge ID in the network will be selected as the root bridge.

- Root port, the designed port selection

Root port is the port which has the least root bridge path cost, which is used for transmitting data to root node. If several ports have the same path cost to root bridge, the port that has the lowest port priority will be the root port.

Designated port: the port that transmits data to the downstream switch, at the same time sends STP message to maintain the spanning tree state.

STP configuration information transmission mechanism:

- When the network is initialized, all the equipments will take themselves as root bridge, and generate the configuration message that take themselves as root, then send the message out in the term of Hello Time;
- If the port that received configuration information is root port, and the received configuration information is higher in priority than the port configuration information, then the equipment will add Message Age which is taken in configuration message in a certain principle, and start timer to time this configuration, at the same time the configuration information will be transmitted from the designated port of the equipment.
- If the configuration message the designated port received is lower in priority than its own port's configuration message, it will send out better configuration message as response immediately.
- If there is fault on one path, the root port on the path will no longer receive any configuration information new, while the old configuration information will be dropped because of overtime, then the equipment will regenerate the configuration information that take itself as root and send out BPDU and TCN BPDU to trigger spanning tree's re-computing and get a new path to replace the faulted link, which will revert network connection.

However, the new configuration information getting from re-computing will not spread all through the network immediately, so the old root port and designated port will not realize the network topology change and continue transmitting data in the old path. If the newly selected root port and designated port start data transmitting immediately, provisional loop may happen.

STP timer:

- Forward Delay: the delay time of the switch state transformation. Link fault will trigger the network re-compute the spanning tree, and the spanning tree structure will change correspondingly. But the new configuration information that has just been re-computed will not spread all through the net immediately, if the newly selected root port and the designated port start data transmission immediately, it may bring temporary path loop. To stop it, STP take state transformation mechanism. The root port and designated port need to go through a betweenness stage before transmitting data, the stage can enter Forwarding stage only after two times Forward Delay time delay, which confirms that the configuration message has spread all through the network;
- Hello Time is used for detecting if there is fault in the link. The switch will send hello message out every Hello Time to check out if the link has any fault;

- Max Age is the parameter used to judge if the configuration information stored in the switch is 'out of time', the switch will drop the overtime configuration information.

12.1.5 RSTP principle overview

RSTP adds the mechanism that the port can transform from jam state to transmission state on the base of ordinary STP protocol, which quickens the topology convergence speed. In the pot to pot link that is connected with only two switch ports, proposal/agreement mechanism can be brought in and only the designated port's one handshake with downstream bridge, so that the link can be transformed quickly. The port that is connected directly to the terminal, not the other bridges, is defined as edge port, which can go directly into transmission state without out any delay. Because the bridge can not know if the port is connected with the terminal, manual configuration is needed.

12.1.6 STP related protocol and standard

The related protocol includes:

- IEEE 802.1D: Spanning Tree Protocol;
- IEEE 802.1w: Rapid Spanning Tree Protocol;
- IEEE 802.1s: Multiple Spanning Tree Protocol

12.2 Configure STP

12.2.1 Default STP configuration

Function	Default
Global STP function	Disable
Port STP function	Enable
STP and port priority	128
STP and system priority	32768
Network diameter	7
Port cost	Usually according to the physical feature the default value is shown below: 10Mbps: 2000000 100Mbps:200000 1000Mbps: 20000 10Gbps: 2000
The maximum package number every hello time	3
max-age timer	20s
hello-time timer	2s
forward-delay timer	15s

12.2.2 Root bridge/back-up root bridge

Step	Command	Description
1	config	Enter global configuration mode
2	spanning-tree root { <i>primary, secondary</i> }	Set the switch to root switch or back-up root switch for spanning tree
3	exit	Return to privileged EXEC mode
4	show spanning-tree	Show STP configuration

12.2.3 Port priority configuration

Step	Command	Description
1	Config	Enter global configuration
2	interface port <1-MAX_PORT_NUM>	Enter Ethernet physical port mode
3	[no] spanning-tree priority <0-240>	Set port priority for spanning tree
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show STP configuration

12.2.4 Switch priority configuration

Step	Command	Description
1	config	Enter global configuration mode
2	[no] spanning-tree priority <0-61440>	Set the switch priority for spanning tree 0-61440 the switch priority
3	exit	Return to privileged EXEC mode
4	show spanning-tree	Show STP configuration

12.2.5 Path cost configuration

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <1-MAX_PORT_NUM>	Enter Ethernet physical port mode 1-MAX_PORT_NUM the equipment port number

3	[no] spanning-tree path-cost <0-20000000>	Set port inner path cost for spanning tree 0-20000000 port inner path cost
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show STP configuration

12.2.6 Maximum port transmitting rate configuration

Use this command to configure the maximum BPDU number that is allowed to be sent every Hello Time for MSTP. The parameter is a relative value, without any unit. The larger the parameter is set, the larger the message number that is allowed to be sent every Hello Time, and the more switch resource will be cost. Like time parameter, the configuration will take effect only in the root switch. By default, the value is 3. The configuration step is show below:

Step	Command	Description
1	config	Enter global configuration mode
2	[no] spanning-tree transit-limit <1-10>	Set the switch maximum sending rate
3	Exit	Return to privileged EXEC mode
4	show spanning-tree	Show MSTP configuration

12.2.7 STP timer configuration

- The switch has three time parameter: Forward Delay, Hello Time and Max Age:
 - Hello Time: the time interval of the switch sending the bridge configuration information (BPDU), which is used for the switch to detect if there is default with the link. Every Hello Time, the switch will send hello message to the switches around to make sure if there is default with the link.
 - The default value is 2s, user can change the value according to the network situation. When there are frequent changes in the network links, the value can be shortened to enhance the spanning tree protocol stability. Contrarily, enlarging the value will reduce the resource occupancy rate to system CPU of STP.
 - Forward Delay: confirm the time parameter of the switch's state transplant. Link fault will bring the network re-computing the spanning tree, and the STP structure will change accordingly, but the new configuration information by computing will not spread all through the network. If the newly selected root port and the specified port start data transmission immediately, provisional route cycle may happen. To prevent this, the protocol take a state transplant mechanism: the root port and designated port will have to go through a betweenness before data transmission, and only when the betweenness goes through Forward Delay can the ports enter transmission state. This delay confirms that the new configuration information has spread all through the network.

The default value is 15s, user can change it according to the situation, increase the value when the network topology change is not frequent, and decrease it on the contrary.

- Max Age: the bridge configuration information that STP uses has lifecycle to judge if the configuration information is out of time. The switch will drop the outdated configuration information. When the bridge configuration information is out of time, the spanning tree protocol will re-compute the spanning tree.

The default value is 20s, a smaller value will result in the spanning tree re-computing much too frequent, while a value that is much too large will lead to the spanning tree protocol unfitness to the network topology structure change.

Step	Command	Description
1	config	Enter global configuration mode
2	[no] spanning-tree hello-time <1-10>	Set the switch time parameter Hello Time
3	[no] spanning-tree forward-delay <4-30>	Set the switch time parameter Forward Delay
4	[no] spanning-tree max-age <6-40>	Set the switch time parameter Max Age
5	exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.2.8 Configure edge port

12.2.9 STP mcheck operation

There are two working mode on the switch that supports MSTP: STP compatible mode and MSTP mode. If in a network the port of the switch that is running MSTP is connected with the switch that is running STP, the port will change into STP compatible mode automatically. But if the switch that is running STP is removed, the port can not change into MSTP mode automatically, but still works in STP compatible mode. Of course, if the port receives new STP message later, the port will return to STP compatible mode. The configuration step is shown below:

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <1-MAX_PORT_NUM>	Enter Ethernet physical port mode <i>MAX_PORT_NUM</i> the maximum port number that the equipment supports.
3	spanning-tree mcheck	Force the port to move back to MSTP mode
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.2.10 Configure STP/RSTP mode switch

Step	Command	Description
1	Config	Enter global configuration mode
3	spanning-tree mode{stp/rstp/mstp}	Configure spanning tree work mode

4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.2.11 Configure link type

The two ports that is connected by point to point link can move to transmission state rapidly through transmitting synchronal message, which decreases unnecessary transmission delay time. By default, MSTP sets the link type of the port according to duplex state. Full duplex port is thought to be point to point link, while half duplex is thought to be shared link.

Users can configure by hand to force the current Ethernet ports and point-to-point link connected, but if the link point-to-point link is not a problem in the system would, under normal circumstances, the proposed user of this configuration is set automatically, by Automatic port discovery is linked with point-to-point link. Reverse order no spanning-tree link-type link state port to restore the default values. Specific configuration steps are as follows:

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <i><1-MAX_PORT_NUM></i>	Enter Ethernet physical port mode <i>MAX_PORT_NUM</i> the maximum port number that the equipment supports
3	spanning-tree link-type <i>{point-to-point shared}</i>	Set the port's link type
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration.

12.2.12 Statistics clear configuration

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <i><1-MAX_PORT_NUM></i>	Enter Ethernet physical port mode <i>MAX_PORT_NUM</i> the maximum port number that the equipment supports.
3	spanning-tree clear statistics	Clear the port stat. information to zero
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.2.13 Monitoring and maintaining

Commands	Description
show spanning-tree	Show the basic information of spanning tree
show spanning-tree detail	Show the detailed information of the spanning tree
show spanning-tree port-list [portlist]	Show the basic information of the spanning tree port list

12.2.14 Typical configuration instance

- There are 3 RAISECOM switch, A, B, C increase according to the equipment MAC address. By configuring the switch priority to select the root bridge to A or B freely, so that the topology can be changed;
- Network structure figure:

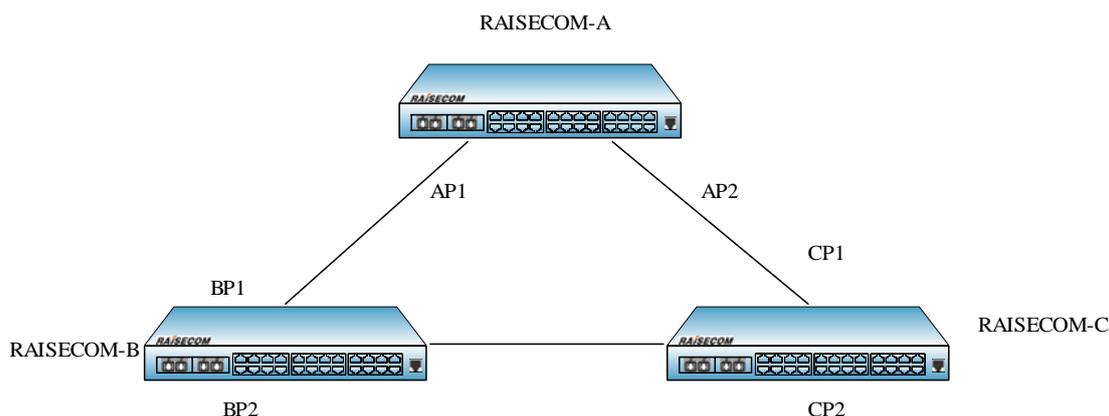

Fig 13-2: network structure

- Configuration step:

Open A, B, C global STP:

```
Raisecom(config)#spanning-tree enable;
```

Set the STP working mode of port AP1, AP2, BP1, BP2, CP1, CP2 to RSTP;

By default, check out the stable topology structure:

```
Raisecom#show spanning-tree
```

A: the switch's AP1, AP2, as the designated port is in normal transmission state;

B: the switch's BP1, as the root port, is in normal transmission state, while BP2 is in block state;

C: the switch's CP1, as the root port, is in normal transmission state, while CP2 is in block state;

Set the priority of B to 4096, and repeat the following step:

```
Raisecom(config)#spanning-tree priority 4096
```

When the topology is stable the root bridge will change into A, the port AP2, BP1 between A and c will be in block state.

MSTP configuration

12.3 MSTP principle introduction

12.3.1 MSTP overview

MST regions (Multiple Spanning Tree Regions), is made of several switches in the switch network and the network segments between them. These switches have all started MSTP, own the same domain name, VLAN to spanning tree mapping configuration and the same MSTP modification class configuration, and have physical link connection.

MSTI (Multiple Spanning Tree Instance) is the spanning tree in the MST domain. A MST domain can create several spanning trees through MSTP, each tree is independent.

VLAN mapping table is an attribution of MST domain. IST and CST (Common Spanning Tree) constitute the switch network spanning tree (Common and Internal Spanning Tree). IST is part of CIST in MST domain, which is a special multi-spanning tree instance.

CST is the simple spanning tree connecting all the MST domain in the switch network. If each MST is seen as a 'switch', CST is a spanning tree computed by the 'switches' using STP and RSTP.

CIST is a single spanning tree connected with all the MST domain in the switch network, which is formed by IST and CST.

Domain root means the tree root of IST and MSTI in the MST domain. The topology of each spanning tree in the MST domain is different, so the domain root may be different as well. Common Root Bridge means the tree root of CIST.

12.3.2 MSTP principle

MSTP divide the two-layer network into several MST domain, between each domain the CST is created by computing, while in the domain several spanning tree is created by computing by computing, each spanning tree is called a MSTI.

- The computing of CIST spanning tree

After comparing the configuration information, the switch that has the highest priority all through the network will be selected as the tree root of the switch. In each MST domain MSTP will create IST through computing, while MSTP will treat each MST domain as a single switch, and create CST in the MST domain by computing. CST and IST constitute the switch network CIST.

- MSTI computing

In the MST domain, according to the mapping relationship between VLAN and the spanning tree instance, MSTP will generate different spanning tree instance for different VLAN. Each spanning tree will make calculation respectively, the calculation process is similar with the process of STP/RSTP spanning tree computing.

- STP algorithm process

It is the same with STP/RSTP.

12.4 MSTP configuration

12.4.1 The default MSTP configuration

Function	Default value
Global MSTP function	Disabled
PORT MSTP function	Enabled
Max jump number of MST domain	20
The priority of STP port	128
The system priority of STP	32768
Network diameter	7
Port cost	According to the physical features, the usual situation by default is show below: 10Mbps: 2000000 100Mbps: 200000 1000Mbps: 20000 10Gbps: 2000
Max packet sent out number every Hello Time	3
max-age timer	20s
hello-time timer	2s
forward-delay timer	15s
MST domain modifying priority	0

12.4.2 MSTP domain configuration

When the switch running in MSTP mode, the switch can be configured the domain information where it belongs to. Which MST domain a switch belongs to is determined by the domain name, VLAN mapping table and MSTP modification configuration. By the following steps user can put the current switch into a special MST domain.

Annotation: MST domain configuration view is used here. To configure MST domain name, modification class and the relationship between VLAN and instances, it is needed to enter MST domain view. If the configuration is not enabled, then the configuration information will only be recorded but not activated. The configuration is shown below:

Step	Command	Description
1	config	Enter global configuration mode

2	spanning-tree region-configuration	Enter MST domain configuration mode
3	[no] name <i>name</i>	Set MST domain name
4	[no] revision-level <i>level</i>	Set MST domain modification class; Level: modification class, range is 0-65535, the default value is 0
5	instance <0-4095> vlan <1-4094>	Set mapping relationship from VLAN to instances for MST domain. 0-4095 the instance number; 1-4094 VLAN ID
6	exit	Return to global configuration mode
7	spanning-tree region-configuration active	Activate MST domain configuration information
8	exit	Return to privileged EXEC mode
9	show spanning-tree region-configuration	Show MST domain configuration information.

12.4.3 Configure MSTP domain maximum hop number

MST domain maximum hop number confines the scope of MST domain. Only when the configured switch is the domain root, can the configured maximum hop number be taken as MST domain maximum hop number, while other not-domain root switches configuration is not valid on it.

From the root switch of the spanning tree in the domain, BPDU in the domain hop number will decrease by 1 when transmitted by one switch, and the switch will drop the configuration information that receives 0 hop number. It will make the switch that is out of the max hop number not being able to take part in the spanning tree calculation, which confines the scope of MST domain.

For instance: if the maximum hop number of the domain root switch is set to 1, the spanning tree function in the domain is not available, because only this switch takes part in the spanning tree computing. By default, the maximum hop number is 20, or to hop down 19 steps along the spanning tree path from the domain root. The configuration is shown below:

Step	Command	Description
1	config	Enter global configuration mode
2	[no] spanning-tree max-hops <1-40>	Set the maximum hop number of the switch MST domain
3	exit	Return to privileged EXEC mode
4	show spanning-tree	Show MSTP configuration

12.4.4 Configure root bridge/back-up root bridge

On the one hand, MSTP can configure the switch priority, and then after a spanning tree calculation, to

determine the root of the tree root switch to back up or exchange; On the other hand, the user can also specify the order directly. It should be noted that if the root switch designated direct way, then the whole network, users can not modify the proposed switch to any of the priority; Otherwise, the root cause designated switch or switch back up the root is invalid.

Users can instance instance-id parameter to determine the root switch, or switch to back up the root of the entry into force of instance. If the instance-id value is 0, or omit parameters instance instance-id, the current switch will be designated as the root of the CIST or switch to back up the root switch.

In the instance of the current switch in the type of root is independent of each other, that is, it can be used as an instance of the root switch or switch back up the root, at the same time as other instances of tree roots or switch to back up the root switch. But at the same instance of a tree, the same can not switch it as a root switch and root as a backup switch.

At the same time, the user can not be designated as an instance of spanning tree two or more root switch; On the contrary, the user can specify multiple spanning tree with a back-up roots. Under normal circumstances, the proposal for a user to specify a spanning tree roots and a number of back-up roots.

When the root switch failure or shutdown, the switch can replace the backup root root switch into the corresponding instance of the root switch. However, at this time if the user has set up a new root switch, then switch back up the root will not be a root switch. If a user to configure a number of instances spanning tree root switch back up, when the root switch fails, MSTP will choose the smallest of the MAC address of the switch as a backup root switch.

By default, the switch can not be taken as the root switch of the spanning tree or the back-up root switch of the spanning tree. Use **no spanning-tree[instance instance-id] root** revert command to restore the default configuration. Specific configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	spanning-tree [instance instance-id] root {primary, secondary}	For a certain spanning tree instance, set the switch as the root switch or back-up root switch. <i>instance-id</i> instance number, range is 0-4095
3	exit	Return to privileged EXEC mode
4	show spanning-tree	Show MSTP configuration

12.4.5 Configure the port priority

Spanning tree protocol spanning tree calculation, the elections need to root port (root port) and designated ports (designated port), in the path of the port costs in line under the premise of the port-side ID of the smaller ports more vulnerable to root for the election or designated port. Users can set up port priority, to reduce port ID, and then there's the purpose of controlling spanning tree protocol to choose a specific port to become the root port or the designated port. With the same priority, the port that has smaller number has higher priority.

Same with the priority of configuring the switch, port priority is independent in different cases. Users can use **instance** instance-id parameter to determine the configuration of port-priority case. If the instance-id value is 0 or parameters **instance** instance-id is omitted, it is configured for the CIST port priority.

Note: The value of priority must be a multiple of 16, such as 0,16,32,48 and so on, the default value of 128.

Specific configuration steps are as follows:

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <1-MAX_PORT_NUM>	Enter Ethernet physical port mode; MAX_PORT_NUM the maximum port number that the equipment supports
3	[no] spanning-tree [instance instance-id] priority <0-240>	Set port priority for a certain spanning tree instance instance-id instance number, range is 0-4095 0-240 port priority value
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.4.6 Configure the switch priority

Bridge ID switch determines if the size of this switch can be selected as the root of the tree. Through the allocation of a smaller priority, the smaller switches Bridge ID can be got so that a certain switch can be the spanning tree root. Priority same, MAC address for the small roots.

Same with the configuration root and backup root, the priority is independent with each other in different instance configurations. Users can use **instance** instance-id parameter to determine the priority allocation of instance. If the instance-id value is 0, or when the parameters **instance** instance-id is omitted, it is configured for the CIST bridge priority.

Note: The value of priority must be in multiples of 4096, such as 0, 4096, 8192, and so on, the default value is 32,768. Specific configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	[no] spanning-tree [instance instance-id] priority <0-61440>	Set port priority for a certain spanning tree instance instance-id instance number, range is 0-4095 0-61440 port priority value
3	exit	Return to privileged EXEC mode
4	show spanning-tree	Show MSTP configuration

12.4.7 Configure the network diameter of the switch network

RSTP in the agreement, the network diameter refers to the number of switches in the network to exchange

up to the path that, switch the number of nodes. MSTP in the agreement, the network diameter settings only effective CIST for example MSTI invalid. And in the same region, no matter how many nodes path, just as a computing node. This fact, the network should be defined as the diameter across the domain up to that path, the number of domains. If the network has only one domain, then running network diameter is 1.

MST with the domain of the largest jump a few similar, if and only if the switch configuration for the CIST root switch, configure the entry into force.

Comparison of the MST's largest domain is used to jump a few domain characterization of the size of the network diameter is the characterization of the entire network of the size of a parameter. Network that the greater the diameter of a larger network.

When the user switches to configure the network parameters in diameter, MSTP through the switch will automatically calculate the Hello Time, Forward Delay, and Max Age three times to set the parameters for a better value.

Default network with a diameter of 7, the corresponding three time are their default values respectively. Specific configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	[no] spanning-tree bridge-diameter <2-7>	Set the diameter of the switch network
3	exit	Return to privileged EXEC mode
4	show spanning-tree	Show MSTP configuration

12.4.8 Path cost configuration

When STP is computing the spanning tree, it is needed to vote root port and designated port, the less the port patch costs, the easier the port be voted as root port or designated port. Users can use **instance** instance-id parameter to determine the instance of the port inner path cost of the configured port. If the instance-id value is 0, or when the parameters **instance** instance-id is omitted, it is configured for the CIST inner patch cost.

Usually port cost depends on the physical features, the default case is:

- 10Mbps is 2000000;
- 100Mbps is 200000;
- 1000Mbps is 20000;

Specific configuration is as follows:

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <1-MAX_PORT_NUM>	Enter Ethernet physical interface mode <i>MAX_PORT_NUM</i> the maximum port number that the equipment supports
3	[no] spanning-tree [instance instance-id] path-cost <0-200000000>	Set the port inner patch cost for a certain spanning tree instance

		<i>instance-id</i> instance number, range is 0-4095
		200000000 the maximum patch cost value
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.4.9 Configure the port's maximum sending rate

Use the command to configure the maximum BPDU number that is allowed to be sent every Hello Time for MSTP. This parameter is a relative value, not units, the configuration parameters have been greater, each with Hello Time allowed to send the message, the more the number, but also will take up more resources to switch. With the same parameters of the time, only the root switch configuration comes into force.

By default, this value is 3. Specific configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	[no] spanning-tree transit-limit <1-10>	Set the switch port maximum sending rate
3	Exit	Return to privileged EXEC mode
4	show spanning-tree	Show MSTP configuration

12.4.10 Configure STP timer

- There are three time parameter: Forward Delay, Hello Time and Max Age:
 - Hello Time: the time interval of the switch's sending BPDU, which is used to determine if there is fault in the link. Every Hello Time the switch will send hello message to the switches nearby to make sure if there is fault with the link.
 - The default value is 2s, user can change the value according to the network state. If there is frequent change in network links, the value can be shortened in a certain degree to enhance STP stability. On the opposite, enlarging the value will decrease STP resource taken rate to the system CPU.
 - Forward Delay: to make sure the time parameter of the switch state safe transformation. Link fault will bring in the re-computing of the spanning tree and the corresponding change of the network structure, but the new configuration information that is re-computed can not spread all through the network. If the newly elected root port and designated port started immediately transmit the data, may cause a temporary path of the loop. To this end an agreement to adopt a state transfer mechanism: the root port and designated port will go through a betweenness before data re-transmission (state of learning), a state in the middle Forward Delay after delay of time before they can enter the state forward. The delay to ensure that the new configuration information has been spread throughout the network.
 - Default value is 15 seconds, the user can adjust the value of the actual situation, when the network topology changes frequently are not able to reduce the value, increasing the contrary.
 - Max Age: the bridge configuration information that is used by the spanning tree protocol has life cycle to determine whether the configuration information is out of date. The switch will discard the configuration information out of date. When the bridge configuration information expired, spanning tree protocol will be re-spanning tree.

Default is 20 seconds, the value is too small will lead to weight spanning tree calculation too often, too

much will lead to spanning tree protocol in a timely manner can not adapt to the network topology.

The entire network to exchange all of the switches used CIST root switch on the three parameters of the time, only in the root switch configuration on the entry into force. Specific configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	[no] spanning-tree hello-time <1-10>	Set the switch time parameter Hello Time
3	[no] spanning-tree forward-delay <4-30>	Set the switch time parameter Forward Delay
4	[no] spanning-tree max-age <6-40>	Set the switch time parameter Max Age
5	exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.4.11 Configure edge port

Edge port: the port that has no direct connection to the switch or indirect connection to any switch through the network.

Configure the edge port so that the port state can transform into transmission state rapidly, without waiting for; for Ethernet port that is has direct connection with user's terminal equipment, it is supposed to be set to edge port for rapid transformation to transmission state.

If a port is set to edge port auto detection (auto), then the attribution of the edge port is decided by the actual situation. If a port is set to edge port (force-true), when the port receive BPDU the actual running value will become not-edge port, which will keep the state until the configuration is changed.

By default, all the network switch ports will be set to auto-detect. The reverse command **no spanning-tree edged-port** restores the default value of the edge port attribution. Specific configuration is as follows:

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <1-MAX_PORT_NUM>	Enter Ethernet physical port mode <i>MAX_PORT_NUM</i> the maximum port number that the equipment supports
3	spanning-tree edged-port {auto force-true force-false}	Set the edge port attribution.
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.4.12 STP mcheck operation

There are two working mode on switch ports that support MSTP: STP compatible mode and MSTP mode. Assuming an exchange network run MSTP switch port connected to the operation of the STP switches, the port will be automatically moved to the STP compatibility mode. However, at this time if the operation of the STP switch will be pulled away from the agreement, the port can not be automatically moved to the MSTP mode, STP will continue to work in the compatibility mode to run. At this point by **mcheck** operation it can be moved to MSTP mode. Of course, if later this port receives a new message STP again, the port will return to the STP compatibility mode. Specific configuration steps are as follows:

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <i><1-MAX_PORT_NUM></i>	Enter Ethernet physical port mode <i>MAX_PORT_NUM</i> the maximum port number that the equipment supports
3	spanning-tree mcheck	Force the port to move to MSTP mode
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.4.13 Configure STP/MSTP mode switch

When STP is enabled, two spanning tree mode is supported: STP compatible mode and MSTP mode.

- STP compatible mode: do not implement the rapid transformation from alternate port to root port. Only STP configuration BPDU and topology change notice (STP TCN BPDU) will be sent out. The un-identified part will be dropped when MST BPDU is received.
- MSTP mode: sending MSTP BPDU. If the opposite end of the local switch port is running STP, the port will move to STP compatible mode. If the opposite end of the local switch port is running RSTP, the local will keep MSTP and take it only as out domain information.

The steps to configure the switch spanning tree mode are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	spanning-tree mode { <i>stp/mstp</i> }	Set the spanning tree running mode
3	exit	Return to privileged EXEC mode
4	show spanning-tree	Show MSTP configuration

12.4.14 Configure link type

By transmitting synchronal message the two ports that is connected by point to point link can move to transmission state rapidly, which reduces the unnecessary transmission delay. By default, MSTP set the link type of the port according to duplex state. Full duplex port is seen as point to point link, while half duplex

port is seen as shared link.

Users can configure by hand to force the current Ethernet ports and point-to-point links connected, but the system will get into trouble if the link is not point to point link, usually it is supposed that this configuration is set to be auto so that the system will find out if the ports are connected with point to point link. Reverse command **no spanning-tree link-type** recovers the default value of the link state of the port. Specific configuration are as follows:

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <1-MAX_PORT_NUM>	Enter Ethernet physical port mode MAX_PORT_NUM the maximum port number that the equipment supports
3	spanning-tree link-type {point-to-point / shared}	Set the link type of the port
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.4.15 Configure static clear

MSTP counts each MSTP port BPDU message number of the following types: in STP message, in RSTP message, in MSTP message, out STP configuration message, out SRTP message (to the switch that is running MSTP, it will be zero forever), out MSTP message.

The steps to clear MST port statistics are as follows:

Step	Command	Description
1	Config	Enter global configuration mode
2	interface port <1-MAX_PORT_NUM>	Enter Ethernet physical port mode MAX_PORT_NUM the maximum port number that the equipment support
3	spanning-tree clear statistics	Clear the port statistics to zero
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show spanning-tree	Show MSTP configuration

12.5 Maintaining and management

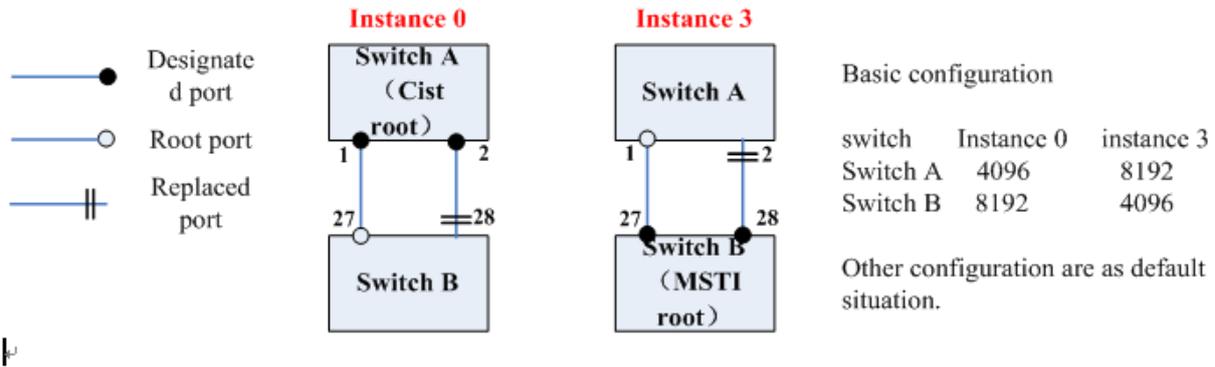

- Show spanning-tree region-configuration: show MST domain configuration.
- Show spanning-tree [instance instance-id]: show multi-spanning tree instance basic information.
- Show spanning-tree [instance instance-id] detail: show multi-spanning tree instance detail.
- Show spanning-tree [instance instance-id] port-list[portlist]: show the basic information of

- multi-spanning tree instance port list.
- Show spanning-tree [instance instance-id] port-list[portlist] detail: show the detail of multi-spanning tree instance port list.

12.5.1 Show instances

The result shown in the following sections are all according to the instance configuration described in the section, the switch that is for display is switch B in the example, the switch that uses this example is rc2828f (28 ports in all).

1. Topology voting figure and basic configuration

2. MST command configuration

<pre>Switch A: Raisecom#hostname SW_A SW_A#config SW_A(config)#create vlan 11-20 active SW_A(config)#interface port 1 SW_A(config-port)#switchport mode trunk SW_A(config-port)#switchport trunk allowed vlan 11-20 SW_A(config-port)#exit SW_A(config)#interface port 2 SW_A(config-port)#switchport mode trunk SW_A(config-port)#switchport trunk allowed vlan 11-20 SW_A(config-port)#exit SW_A(config)#spanning-tree enable SW_A(config)#spanning-tree mode mstp SW_A(config)#spanning-tree region-configuration SW_A(config-region)#name aaa SW_A(config-region)#revision-level 2 SW_A(config-region)#instance 3 vlan 11-20 SW_A(config-region)#exit SW_A(config)#spanning-tree region-configuration active SW_A(config)#spanning-tree instance 0 priority 4096 SW_A(config)#spanning-tree instance 3 priority 8192</pre>	<pre>Switch B: Raisecom#hostname SW_B SW_B#config SW_B(config)#create vlan 11-20 active SW_B(config)#interface port 27 SW_B(config-port)#switchport mode trunk SW_B(config-port)#switchport trunk allowed vlan 11-20 SW_B(config-port)#exit SW_B(config)#interface port 28 SW_B(config-port)#switchport mode trunk SW_B(config-port)#switchport trunk allowed vlan 11-20 SW_B(config-port)#exit SW_B(config)#spanning-tree enable SW_B(config)#spanning-tree mode mstp SW_B(config)#spanning-tree region-configuration SW_B(config-region)#name aaa SW_B(config-region)#revision-level 2 SW_B(config-region)#instance 3 vlan 11-20 SW_B(config-region)#exit SW_B(config)#spanning-tree region-configuration active</pre>

12.6 Typical configuration instance

➤ Destination:

Set sw1, sw2, sw3 to the same MST domain MST1, modification class to 2, and map VLAN1 to instance 1, VLAN2 to instance 2, other VLAN to CIST;

Set MST2, MST3 to contain sw4/sw6/sw7, sw5/sw8/sw9, the correspondence that VLAN map to instance is similar to MST1.

Show the final spanning tree voting, configure the CIST that take sw3/sw4/sw5 as switch.

➤ Network figure

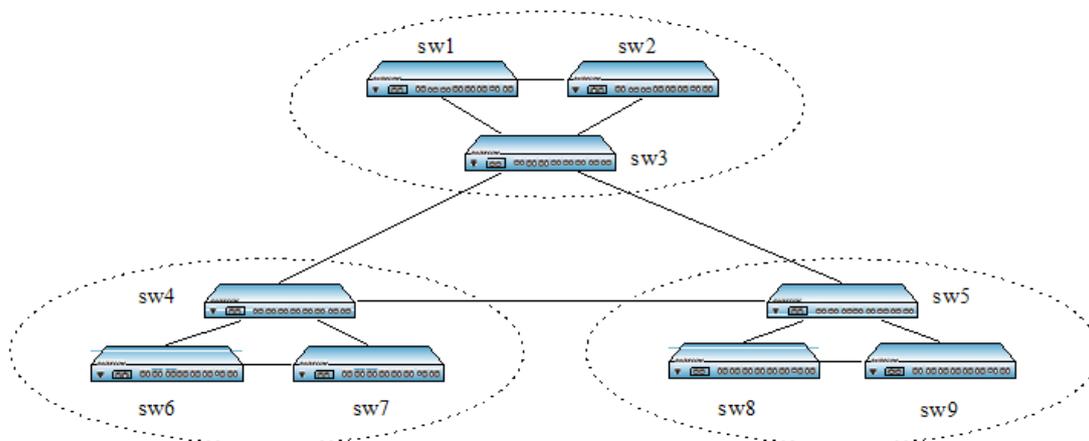

Fig 13-3 network figure

➤ Configuration step:

Step 1:

Configure MST domain configuration information, the domain name is MST, modification class is 2, map VLAN2 to instance 2, others to CIST, and enable the configuration information

Raisecom#config

Raisecom(config)#spanning-tree region-configuration

Raisecom(config-region)#name MST1

Raisecom(config-region)#revision-level 2

Raisecom(config-region)#instance 1 vlan 1

```
Raisecom(config-region)#instance 2 vlan 2
Raisecom(config-region)#exit
Raisecom(config)#spanning-tree region-configuration active
```

Step 2:

Configure MST2 and MST3 in the same way.

Step 3:

To look over the spanning tree configuration information, instance 1 information:

```
Raisecom#show spanning-tree region-configuration
```

```
Raisecom#show spanning-tree instance 1
```

MST1, MST2, MST3 form as complete single spanning tree.

Step 4:

Set the electric physical port on MST1, MST2, MST3 domain to the member port of VLAN1;

In MST1 domain configure the bridge priority of sw3 to 4096, the priority of other switches larger than 4096;

In MST2 domain configure the bridge priority of sw4 to 8192, the priority of other switches larger than 8192;

In MST2 domain configure the bridge priority of sw5 to 8192, the priority of other switches larger than 8192;

In each domain, the topology will vote and create single spanning tree according to STP/RSTP, and create a final tree, the root of which is sw3, and the connection between sw4 and sw5 will be stopped.

There is only one MST1 in MST1/MST2/MST3 domain, sw3/sw4/sw5 is thought to be root, the topology picture is as follows:

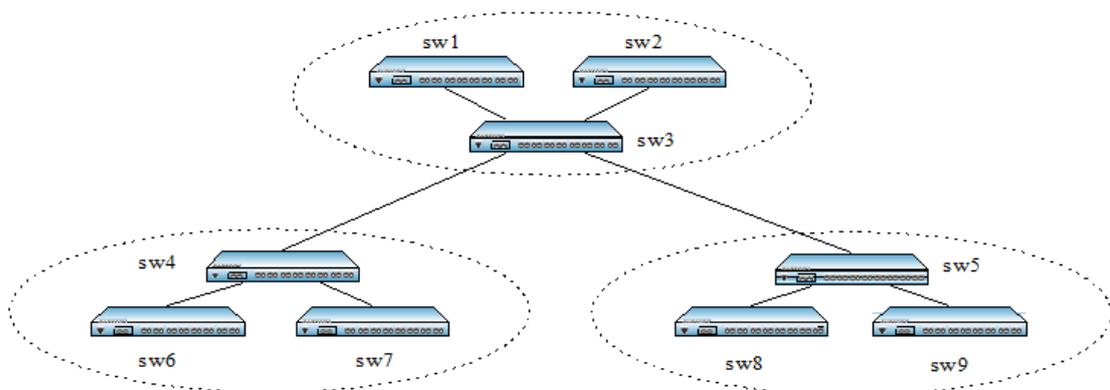

Fig 13-4 topology figure

13.1 Digital diagnoses principle

SFP (Small Form Pluggable) is a kind of optical module in media converter. The fault diagnoses function provides the system a way of performance monitoring. Using the data monitoring function provided by this module, network administrator can forecast the lasting time of the module, insulate the system fault and validate the module compatibility when fixing equipments.

Each SFP module provides five performance parameters: the media converter temperature, inner power supply voltage, sending electronic current, sending optical power and receiving optical power.

The digital diagnoses module polls all the SFP ports every 5 seconds, and gives three datasheet according to the performance parameter getting from the poll: the real-time monitoring table of the optical module, the period performance monitoring table of the optical module, the current period performance monitoring table. When the parameter exceeds the threshold, it will send trap and offer its global switch control.

The index of optical module real-time monitoring table is SFP port number and parameter type. Inside the software the table has stable number of rows, but when you look over it in the command lines only the information of the ports that are active (the row mark is valid) can be shown. Seen from the network management software, the table has stable number of rows, when SFP is not active it means the row mark of the table is invalid. The table restores the parameter value, threshold value, the time and value that the last time the threshold value is exceeded of each parameter for each SFP module. The initialized value of last threshold exceeding is -1000000, the left values are all 0. When the digital diagnose module polls SFP port every 5 seconds, if SFP is active, read SFP's 5 parameter value, adjusting measure, adjusting parameter and threshold value, refresh the parameter value and threshold value of the optical module real-time monitoring table, if it exceeds the threshold value, update the time and value of the exceeding Digital diagnoses configuration. Configure real-time monitoring table that the row mark is invalid. Each row of the table contains 2 variables, which stands for how many 15 minutes' cycle records and 24 hours' cycle records are restored in the parameters of SFP ports. Now digital diagnoses module supports 96 15 minutes' cycle record and 1 24 hours' cycle record at the most.

The index of optical module current period performance monitoring table is SFP port number, period type and parameter type. The table records the maximum value, least value and the average value of the parameters that are within a recording cycle. The table has stable row number, and all the initialized parameter values are 0. When the equipment is started, the digital diagnoses module polls all the SFP ports every 5 seconds, and the value that read first will be evaluated to the maximum, least and average value. Then, if the polling value is larger than the maximum value, refresh it to the larger value; if it is smaller than the least value, refresh the recorded least value, and compute the summation, add 1 on the digit. If SFP is not active when polling, no data record will be refreshed. After 180 polling (15 minutes later), add a row in the period performance monitoring table, and configure the maximum, least and average value of the row's parameter according to current period monitoring table record, cycle type is 15 minutes, then reset all the data in the current period row, and start recording the next cycle. It is the same to record the data of 24 hour cycle. When it reaches 24 hours, add a row in period monitoring table, then reset all the data in the current period row, and start recording the next cycle.

The index of period performance monitoring table of the optical module is port number, cycle type, cycle

recording number and parameter type. The monitoring table restores data of two cycles, that is 15 minutes data and 24 hours data. The table is empty originally. Every 15 minutes, a 15 minutes cycle record will be added to the table. The record number of the newest one is 1, larger recording number means older recording. The table keeps at most 96 fifteen minutes record. When it reaches 96 records, the oldest one will be deleted when a new one is added. Every time it reaches 24 hours, a 24 hour cycle record will be added to the table. The newest recording number is 1, at most 1 twenty-four hour cycle record will be restored in the table, and the old record will be covered every 24 hours.

13.2 Configure digital diagnoses function for optical module

13.2.1 Default digital diagnoses configuration

Function	Default value
Enable/disable sending optical module parameter state unusual trap	Enable sending optical module parameter state unusual trap

13.2.2 Configure optical module parameter state unusual alarm

Step	Command	Description
1	config	Enter global configuration mode
2	snmp trap transceiver <i>{enable/disable}</i>	Enable/disable sending optical module state unusual trap.
3	exit	Return to global configuration mode
4	show interface transceiver	Show digital diagnoses information

13.2.3 Optical module digital diagnostic parameter monitoring and maintenance

Commands	Description
show interface port [<i>port-list</i>] transceiver [<i>threshold-violations</i>] [<i>detail</i>]	Show digital diagnoses information

14.1 Multicast Overview

14.1.1 The confusion of unicast/broadcast

As Internet develops, on one side the interactive data, voice and video information in the network are becoming more and more, on the other side the rising services like electronic commerce, network meeting, network auction, video on demand and remote education are in gradual rise. These services have new request on information security and payment, which traditional unicast and broadcast can not meet well.

14.1.1.1 Information transmission in unicast

With unicast, the system will establish a single data transmission channel for the user who needs the information, and send a single copy to the user, as is shown below:

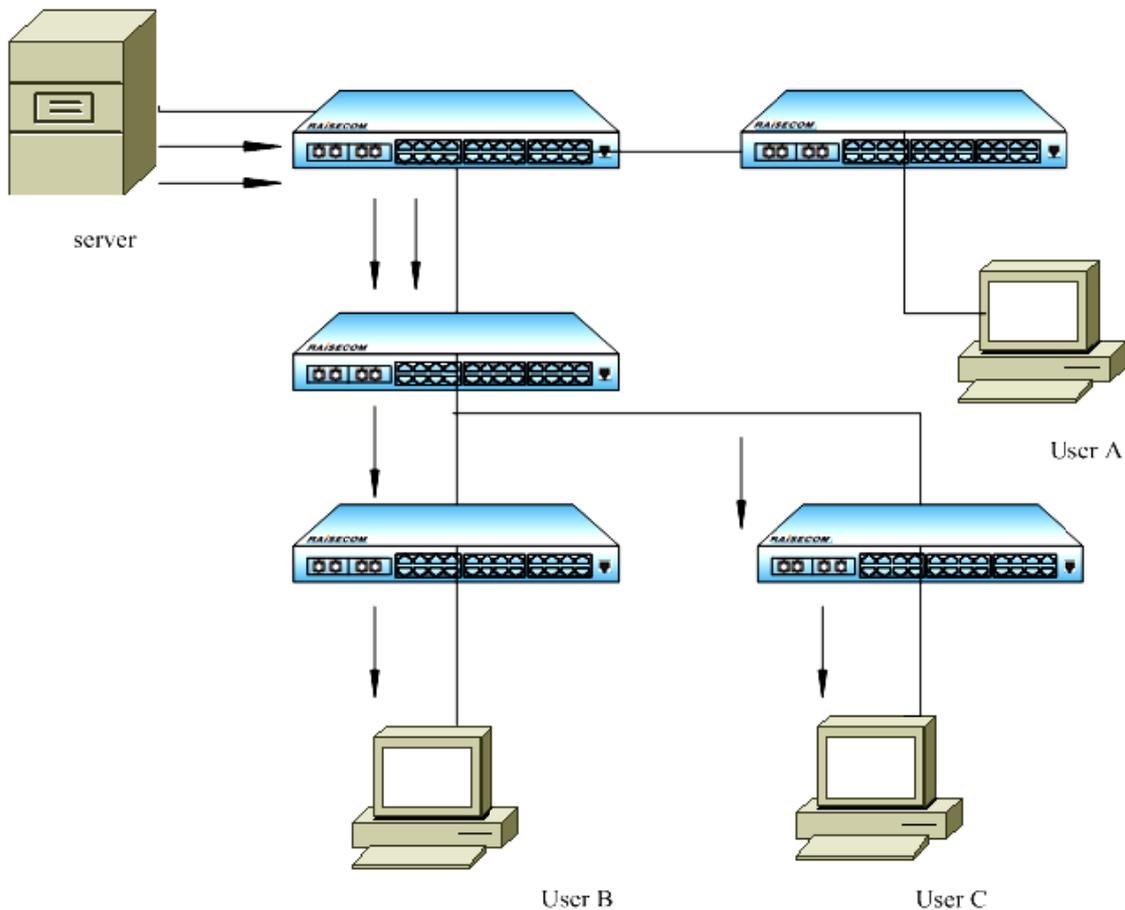

Fig 1-1 unicast transmission

Suppose user B and C need the information, the information source Server will establish transmission channel for user B and C respectively. Because the information capacity transmitted in the network is in proportion to the capacity of users who need the information, when the number of users who need the information is large, there will be several same information stream in the network. Then bandwidth will be

a important bottleneck and unicast goes against sending information in large scale.

14.1.1.2 Transmitting information in broadcasting

Using broadcast, the system will send the information to all the network users, caring not if it is needed, any user can receive the information from broadcasting, as is shown below:

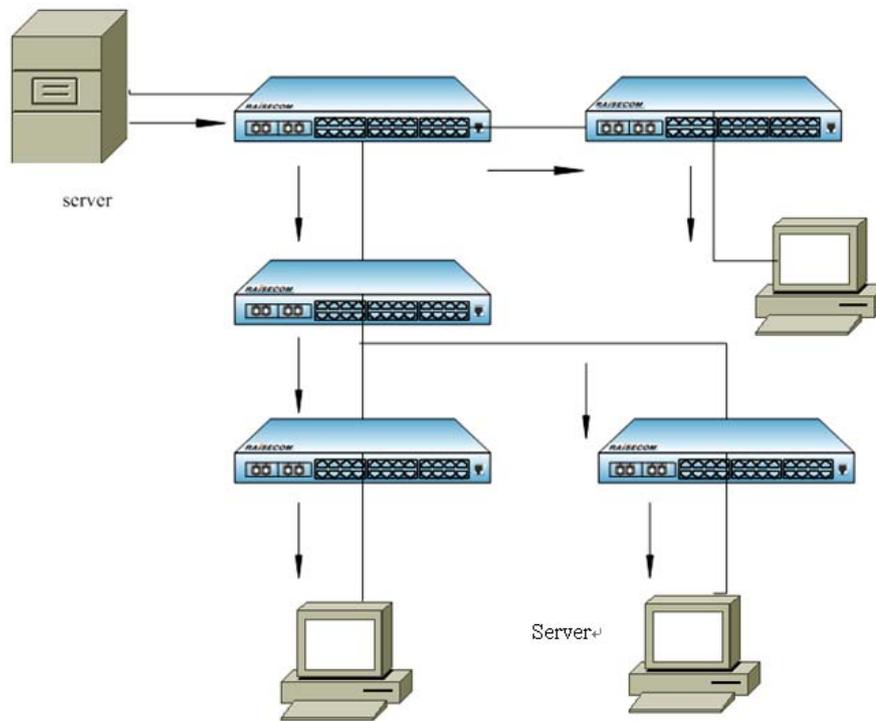

Fig 1-2 Information transmission in broadcast

Suppose user B and C need the information, then information source Server will broadcast the information by router, another network user A can also receive the information, which means information security and payment services can not be ensured. On the other side, when there is not so many users who need the information, network resource use ratio will be quite low, which is a great waste of the bandwidth. In summary, unicast suits the network with rare users, while broadcast suit the network with a lot of people. When the number of users who need the information is not so sure, unicast and broadcast are both low in efficiency.

14.1.2 The advantage of multicast

14.3.4.1 Information transmission in multicast

The appearance of multicast handles the problem in time. When some users in the network need specific information, multicast source send out information only once, and the information sent out will be copied and sent out in the crossing as far as possible, as is shown below:

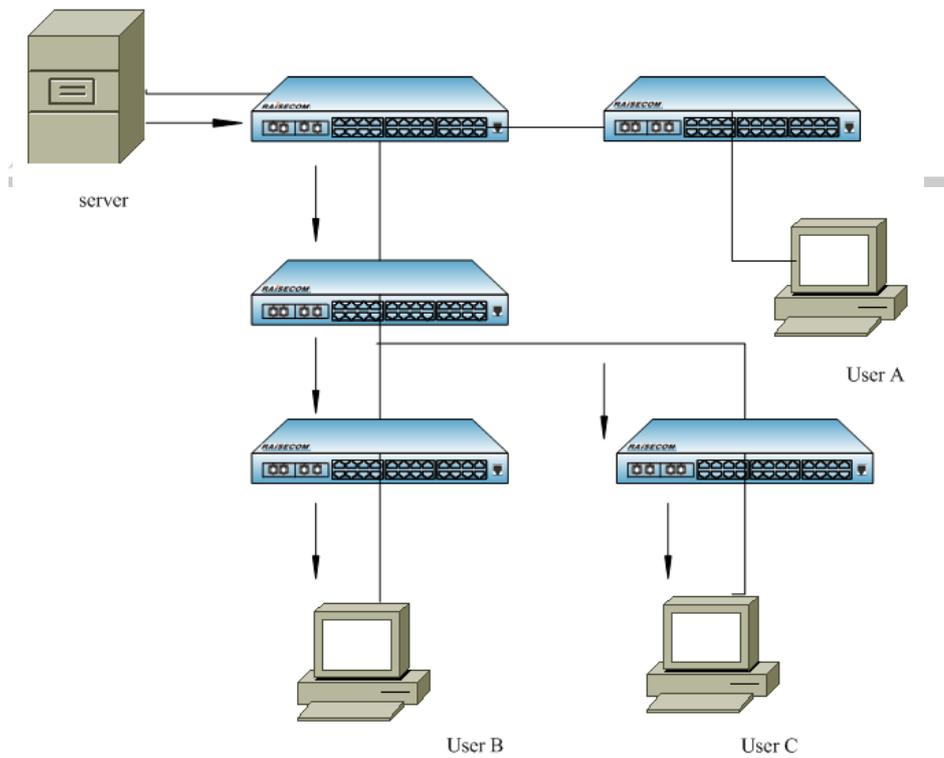

Fig 1-3 Information transmission in multicast

Suppose user B and C need the information, to send the information successfully to the user who really needs it, it is needed to form B, C into a receiver combination, then each switch in the network form its own multicast transmission table according to IGMP message, at last the information will be transmitted accurately to receiver B, C who need it really. In multicast information sender is called ‘multicast source’, but some information receiver call it the ‘multicast group’ of the information. The receiver member who joins the same multicast group can be located in any place in the network, that is to say, there is no domain limit with ‘multicast group’. It should be noted that multicast source does not have to belong to multicast group, it send data to multicast group and don’t have to be receiver itself. There can be several sources sending out messages to one multicast group.

14.3.4.2 Information transmission in multicast

The advantage of multicast is:

Increase the efficiency and decrease the network traffic, ease the load of the server and CPU;

Optimize the performance and decrease the redundant traffic;

Distributed application makes multi-point use possible.

14.2 IGMP Snooping Configuration

This chapter is mainly about how to configure and maintain IGMP Snooping, including:

- ✧ About IGMP Snooping
- ✧ Configuration task list
- ✧ Monitoring and maintenance
- ✧ Typical application
- ✧ Trouble shooting

14.2.1 About IGMP Snooping protocol

IGMP Snooping, unlike ISO module, has no clear concept module, which takes the upper-layer protocol data information as the bottom-layer working consideration factor. In the transmission of multicast, IGMP Snooping confines data flooding to all the ports, but transmits information only to the multicast member ports, which helps saving the bandwidth.

IGMP snooping allows LAN switch to snoop on the IGMP transmissions between the host and the router and to keep track of multicast groups and member ports. When the switch receives an IGMP report from a host for a particular multicast group, the switch adds the host port number to the forwarding table entry; when it receives an IGMP Leave Group message from a host, it removes the host port from the table entry. It also periodically deletes entries if it does not receive IGMP membership reports from the multicast clients.

Layer 2 multicast groups learned through IGMP snooping are dynamic. However, you can statically configure MAC multicast groups by using the **ip igmp snooping static** command. If you specify group membership for a multicast group address statically, your setting supersedes any automatic manipulation by IGMP snooping. Multicast group membership lists can consist of both user-defined and IGMP snooping-learned settings. Raisecom series switches supports 1024 two-layer multicast transmission table item, and support IGMPv1 and IGMPv2 version.

14.2.2 IGMP snooping configuration

This part is about how to configure and maintain IGMP Snooping on switch, including:

- ◇ Enable and disable IGMP Snooping
- ◇ IGMP Snooping aging time
- ◇ Multicast Router port configuration
- ◇ Configuring immediate-leave function
- ◇ Manually configure multicast MAC address table.

14.2.2.1 Default IGMP Snooping configuration

Function	Default value
IGMP SNOOPING starting	On
IGMP SNOOPING out-time	300 秒
Configure the router time	Do not configure
MVR mode	Compatible
Quit immediately	Disabled
Multicast stable transmission table	Not configured

14.2.2.2 IGMP Snooping enable and disable

IGMP snooping is disabled on the switch by default. If IGMP snooping is globally enabled/disabled, all the VLAN will enable or disable IGMP snooping function. The following commands are used to enable IP

IGMP Snooping:

Step	Command	Description
1	config	Enter global configuration mode
2	ip igmp snooping	Enable IGMP Snooping
3	exit	Exit to privilege mode
4	show ip igmp snooping	Show configuration situation

Use **no ip igmp-snooping** command to disable IP IGMP Snooping.

This command is used to globally disable IGMP snooping function. In order to disable IP IGMP snooping function on particular VLAN, use the following commands under VLAN configuration mode.

Step	Command	Description
1	config	Enter global configuration mode
2	vlan <i>vlan-id</i>	Enter VLAN configuration mode
3	no ip igmp snooping	Disable the IGMP snooping function for this VLAN.
4	exit	Exit to global configuration mode
5	exit	Exit to privileged EXEC mode
6	show ip igmp snooping vlan <i>vlan-id</i>	Show VLAN configuration information

In order to enable IGMP snooping function on the VLAN, use **ip igmp snooping** in VLAN configuration mode.

If IGMP snooping is disabled globally, IGMP snooping function can not be enabled on particular VLAN.

If user needs to enable or disable IGMP Snooping function on several VLANs, use **ip igmp-snooping vlan** command in global configuration mode according to the following table:

Step	Command	Description
1	config	Enter global configuration mode
2	ip igmp snooping vlan 1-100	Enable IGMP snooping function on VLAN1-100
3	exit	Exit to privileged user mode
4	show ip igmp snooping	Show IGMP Snooping configuration information

Use **no ip igmp snooping vlan** command to disable IGMP snooping function on several VLAN at a time.

In order to check whether the configuration is correct or not, use show command:

Raisecom#**show ip igmp snooping**

IGMP snooping: Enable

IGMP snooping aging time: 300s

IGMP snooping active VLAN: 1,2

IGMP snooping immediate-leave active VLAN: --

Raisecom#**show ip igmp snooping vlan 2**

IGMP snooping: Enable

IGMP snooping aging time: 300s

IGMP snooping on VLAN 2: Enable.

IGMP snooping immediate-leave on VLAN 2: Disable.

14.2.2.3 IGMP snooping aging time configuration

If switch does detect IGMP Snooping Join or Query message within a period, the subscriber may have left already without sending any leaving message, so the switch needs to be deleted the multicast MAC address from the address table. The default aging time is 300 seconds. Configuration steps are showed as follows:

Step	Command	Description
1	config	Enter global configuration mode.
2	ip igmp snooping timeout <i>timeout</i>	Set IGMP overtime.
3	exit	Exit to privilege EXEC mode
4	show ip igmp snooping	Show IGMP Snooping configuration information

The range of aging time is 30 seconds to 3600 seconds, in order to recover default value, use following command: **no ip igmp snooping timeout**

Example:

Raisecom#**config**

SCOM2826(config)# **ip igmp snooping timeout** 1200

ISCOM2826(config)#**exit**

Raisecom#**show ip igmp snooping**

GMP snooping: Enable

IGMP snooping aging time: 3000s

IGMP snooping active VLAN: 1, 2

IGMP snooping immediate-leave active VLAN: 1

14.2.2.4 Router port configuration

The Multicast Router port can be assigned by dynamically address learning (through IGMP request message), or manually configured (that is to say, multicast report and leave message of downlink hosts can be forwarded to multicast router port). The manual configuration steps of multicast router port are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	ip igmp snooping mrouter vlan <i><1-4094></i> port <i><1-26></i>	Configure router port

3	exit	Exit to privileged EXEC mode
4	show ip igmp snooping mrouter	Show Multicast Router port configuration information

Use following command to delete configured Multicast Router port: no ip igmp snooping mrouter vlan 1 port 2.

Configuration example:

```
ISCOM2826#config
```

```
ISCOM2826(config)#ip igmp snooping mrouter vlan 1 port 2
```

```
ISCOM2826(config)#exit
```

```
ISCOM2826#show ip igmp snooping mrouter
```

```

Ip Address      Port   Vlan  Age    Type
-----
224.0.0.0/8    2      1     --     USER

```

14.2.2.5 Immediate-leave function configuration:

When you enable IGMP Immediate-Leave processing, the switch immediately removes a port when it detects an IGMP version 2 leave message on that port.

The settings are as following:

Step	Command	Description
1	config	Enter global configuration mode
2	vlan 1	Enter VLAN configuration mode
3	ip igmp snooping immediate-leave	Set immediate-leave function on the VLAN.
4	exit	Exit to global configuration mode.
5	exit	Exit to privilege EXEC mode.
6	show ip igmp snooping	Show IGMP Snooping configuration information

In VLAN configuration mode, use **no ip igmp snooping immediate-leave** command to restore default setting:

Configuration example:

```
ISCOM2826#config
```

```
ISCOM2826 (config)#vlan 1
```

```
ISCOM2826 (config-vlan)# ip igmp snooping immediate-leave
```

```
ISCOM2826 (config-vlan)#exit
```

```
ISCOM2826 (config)#exit
```

```
ISCOM2826#show ip igmp snooping vlan 1
```

```
IGMP snooping: Enable
```

```
IGMP snooping aging time: 300s
```

```
IGMP snooping on VLAN 1: Enable.
```

IGMP snooping immediate-leave on VLAN 1: Enable.

In order to configure the immediate-leave function in multiple VLAN, use following commands:

Step	Command	Description
1	config	Enter global configuration mode.
2	ip igmp snooping vlan <i>vlanlist</i> immediate-leave	Set immediate-leave function on the VLAN.
3	exit	Exit to privileged EXEC mode.
4	show ip igmp snooping	Show IGMP Snooping configuration information

In order to restore default settings, use following command: **no ip igmp snooping vlan** *vlanlist*
immediate-leave

Example:

```
iscom2016#config
```

```
iscom2016(config)# ip igmp snooping vlan 1-10 immediate-leave
```

```
iscom2016(config)#exit
```

```
iscom2016#show ip igmp snooping
```

```
igmp snooping is globally Enabled
```

```
igmp snooping aging time is 1200(s)
```

```
IGMP snooping active vlan: 1
```

```
IGMP snooping immediate-leave active vlan:1-10
```

14.2.2.6 Stable multicast transmission table configuration

Usually a port joins multicast router through the IGMP report message from the host. For maintenance, you can add a port to the multicast group manually.

Step	Command	Description
1	config	Enter global configuration mode
2	mac-address-table static multicast <i>mac-addr</i> vlan <i>vlanid</i> port-list <i>portlist</i>	Add the port to the multicast group
3	exit	Exit to privilege user mode
4	show mac-address-table multicast	Show multicast MAC address information

The MAC address is the multicast MAC address, and the format is HHHH.HHHH.HHHH. For example, multicast IP address 224.8.8.8 is mapped to multicast MAC address 0100. 5e08.0808; the range of the port is from 1 to 26. In order to delete the port from multicast group manually, use command **no mac-address-table static multicast** *mac-addr* **vlan** *vlanid* **port-list** *portlist*.

Configuration example:

```
Raisecom#config
```

```
ISCOM2826(config)# mac-address-table static multicast 0100.5e08.0808 vlan 2 port-list 1-6
```

```
ISCOM2826(config)#exit
```

```
ISCOM2826# show mac-address-table multicast
```

```
Multicast filter mode: Forward-all  
Vlan  Group Address  Ports[Static](Hardware)  
-----  
2      0100.5E08.0808  1-6[1-6](1-6)
```

14.2.3 Monitoring and maintenance

Use show command to check switch IGMP snooping running and configuration status:

Step	Command	Description
1	show ip igmp snooping [vlan <i>vlan-id</i>]	Show IGMP snooping configuration information in all the VLAN or designated VLAN of the switch.
2	show ip igmp snooping multicast [vlan <i>vlan-id</i>]	Show multicast router port information (dynamically learned or manually configured) of all the VLAN or a designated VLAN.
3	show mac-address-table multicast [vlan <i>vlan-id</i>] [count]	Show all the multicast MAC address; <i>Count</i> : indicates the total number of multicast MAC address

Use **show ip igmp snooping** command to check configuration information, for example the timer, VLAN configuration information.

Show IGMP Snooping configuration information:

```
Raisecom# show ip igmp snooping
```

```
IGMP snooping: Enable  
IGMP snooping aging time: 300s  
IGMP snooping active VLAN: 1, 2  
IGMP snooping immediate-leave active VLAN: 1
```

Use **show ip igmp snooping vlan *vlanid*** command to show the IGMP snooping information in a particular VLAN. If you do not specify VLAN, all the VLAN information will be displayed, that is all the existent and active VLAN.

Show igmp-snooping multicast router information:

```
Raisecom# show ip igmp snooping mrouter
```

```
Ip Address      Port  Vlan  Age      Type  
-----  
224.0.0.0/8    4     3     --      USER
```

```
Raisecom#show mac-address-table multicast
```

Multicast filter mode: Forward-all

Vlan Group Address Ports[Static](Hardware)

2 0100.5E08.0808 1-61-6

14.2.4 Typical configuration example

1) Configuration instruction:

To realize the switch IGMP Snooping function, it is needed to start IGMP Snooping on the switch (by default it's on). The router port (physical port 1) on the switch connects to the router, while other not-router ports connect to users' PC.

2) Typical network structure figure

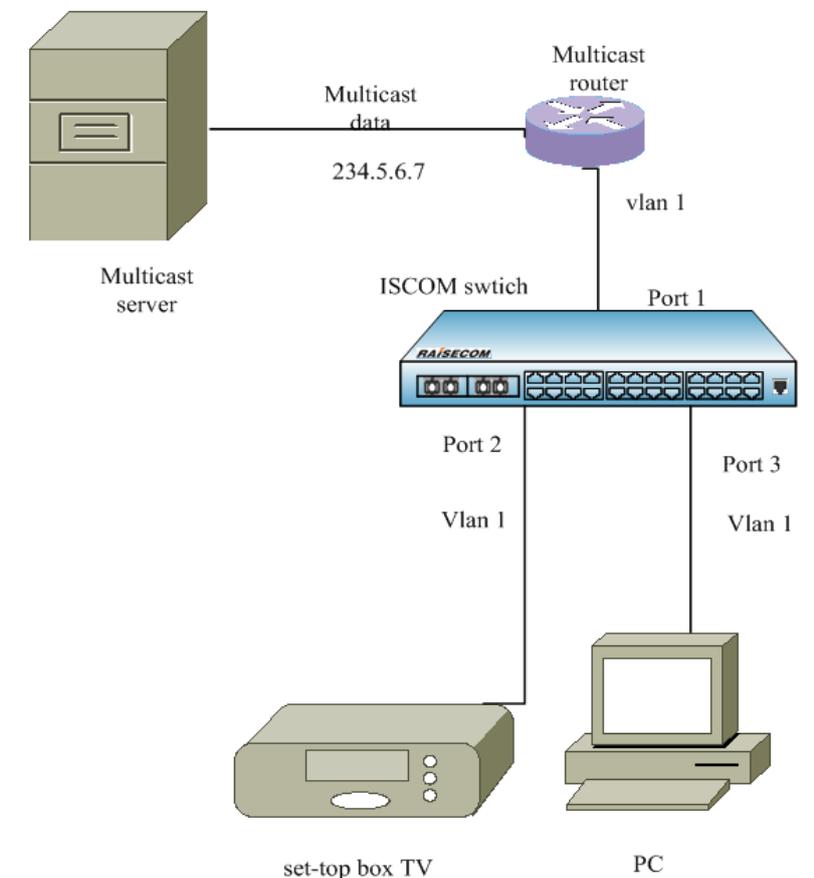

Fig 2-1 Typical IGMP Snooping network structure

3) Configuration command

By default IGMP Snooping function is on, and it will be started to the existed VLAN port. For fig 2-1, use **ip igmp snooping mrouter vlan 1 port 1** to configure the router port on the switch.

14.2.5 IGMP snooping trouble shooting

1. If multicast router port has not been specified, all the IGMP reports will be transmitted to the port directly connected to the router;

2. If it is failed to add port to a multicast group manually, the reason may be incorrect multicast MAC address format or the maximum layer 2 multicast router table (255) has been achieved;
3. If it is failed to delete the port from multicast group manually, the possible reason may be incorrect multicast MAC address format or MAC address/VLAN/port are not existent in multicast router.

14.3 MVR Configuration

This chapter is mainly about how to configure and maintain MVR and IGMP filtration on the switch, including:

- ◇ MVR overview
- ◇ MVR proxy principle introduction
- ◇ IGMP filtration overview
- ◇ MVR configuration
- ◇ MVR monitoring and maintenance
- ◇ MVR proxy configuration
- ◇ MVR proxy monitoring and maintenance
- ◇ IGMP filtration configuration
- ◇ IGMP filtration monitoring and maintenance
- ◇ Typical configuration example
- ◇ MVR and IGMP filtration trouble shooting

14.3.1 MVR principle

Multicast VLAN registration is applied as traffic multicast in the network of service provider, such as TV programme ordering. MVR allows subscriber on the port to order or cancel the multicast traffic in VLAN, allows data traffic sharing for different VLANs. There are two MVR aims:

1. By using simple configurations, use can transmit multicast among different VLANs safely and effectively;
2. Support multicast group joining and leaving dynamically;

The operation manner of MVR is similar to that of IGMP snooping. These two functions can be enabled simultaneously. MVR only processes the joining and leaving of configured multicast groups, the other multicast groups are managed by IGMP snooping. The difference between these two is that: with IGMP snooping, the multicast traffic can be transmitted within only one VLAN, while with MVR the multicast traffic can be transmitted within different VLANs.

There are two operation modes:

1. Compatible mode: all multicast data received at the source port (port connected with multicast router) will be forwarded to the other ports, no matter whether these source ports have members to join in or not. Simultaneously, multicast data are only forwarded to those receiving ports (ports connected with subscribers) which are specified to have already joined in the MVR group, the joining can be in the form of IGMP report or MVR static configuration. IGMP report will not be forwarded to the source port of switch. Therefore, the switch dose not support source port joining dynamically. Under this mode, multicast router should be configured as forwarding all multicast data to the source port, since switch will not send IGMP joining information to the router.

2. Dynamic mode: Received multicast data are only forwarded to those ports which have member to join (source port or receiving port), the joining can be in the form of IGMP report information or MVR static configurations. All received IGMP information is forwarded to the source port of the switch. This method could save much bandwidth.

MVR are operative only on Layer-2. It dose not work on Layer-3. One switch can configure only one multicast VLAN, support 256 multicast groups at most.

14.3.2 MVR proxy principle

MVR proxy provides a complete solution for the multicast operation of two-layer equipments through proxy mechanism. The two-layer network equipments that support MVR proxy take the role of Server on user side, and query user information periodically, and it take the role of Client on the web side, sending the current user's information to the network when needed. This will not only stop the two-layer multicast from flooding, but also help acquiring and controlling user information, at the same time it can help reduce the web side protocol messages and the network load. MVR proxy establish multicast table by holding up the IGMP messages between user and router, the up-link port of Proxy equipment takes the role of host, while down-link port takes the role of router.

14.3.3 IGMP filtration introduction

Administrator needs to limit the multicast users under some circumstances, such as to allow which ports to receive multicast on a switch, which ports to reject multicast data. Use can realize this kind of control on the port by configuring IGMP profile. One IGMP profile includes one or multiple multicast groups, and permit/deny items to access these groups. If one "deny" type IGMP profile is applied to the port, when the port receives IGMP joining information of this group, it will drop and do not allow receiving multicast data from this group. IGMP profile can be applied to dynamic multicast group, not suitable for static group.

In addition, the maximum multicast group can be configured on port.

14.3.4 MVR configuration

This part is about how to configure MVR on the switch, including:

- ◇ Default MVR configuration
- ◇ Global MVR configuration
- ◇ Configure MVR port information

14.3.4.1 Default MVR configuration

Attributes	Default configuration
MVR enable/disable	disabled
Multicast address	Not configured
MVR timeout	600 seconds
Multicast VLAN	1

MVR mode	compatible
Port MVR enable/disable	disabled
Port default configuration	Non MVR (neither source port, nor receiving port)
Intermediate leave	disabled

The steps below should be followed:

- Receiving port can be only ACCESS port, but cannot be TRUNK port. Receiving port can belong to different VLANs, but cannot belong to multicast VLAN;
- The maximum MVR multicast address is 256;
- Since ISCOM28 series switches support Layer-2 multicast, which means multiple IP multicast addresses correspond to one MAC multicast address, MVR multicast address is not allowed using repetitive names during configuration.
- MVR and IGMP snooping can coexist;
- Source port should be in the multicast VLAN;

14.3.4.2 Global MVR configuration

Under the default situation, MVR is disabled. User can carry out the commands below to enable MVR under global configuration mode. Multicast VLAN, multicast address, operation modes can be configured as well. If MVR has not been enabled yet, it is allowed to configure MVR. Once MVR is enabled, these configurations will take effect at once.

Step	Command	Description
1	config	Enter global configuration mode
2	mvr enable	Enable MVR
3	mvr group ip -address [count]	Configure IP multicast address, if the parameter count is specified, you can configure a consecutive MVR group addresses (the range for count is from 1 to 256, 1 by default)
4	mvr timeout timeout	optional, MVR multicast entity timeout, unit is second, range is from 60 to 36000, 600 seconds by default.
5	mvr vlan vlanid	Optional, to specify the VLANs for receiving multicast, all source ports should belong to this VLAN. Range is from 1 to 5094. 1 by default.
6	mvr mode {dynamic compatible}	Optional, MVR operation modes: dynamic: Dynamic mode compatible: Compatible mode
7	exit	Back to privileged EXEC mode
8	show mvr	Show MVR configuration
9	show mvr members	Show MVR group address

To disable MVR, carry out command **mvr disable** under global configuration mode. To set the other configurations back to default status, you can use the command **no mvr {mode | group ip-address | timeout | vlan}**.

Command **mvr group ip -address** indicates which multicast traffic can be received. If this parameter is not specified, all traffics will be received.

The example below shows how to enable MVR, how to configure multicast address, timeout and multicast

vlan:

```
raisecom(config)# mvr enable
```

```
raisecom (config)# mvr group 234.5.6.7
```

```
raisecom (config)# mvr timeout 180
```

```
raisecom (config)# mvr vlan 22
```

```
raisecom (config)# mvr mode dynamic
```

To check if the configurations are correct, use command **show**:

```
Raisecom#show mvr
```

```
MVR Running: Enable
```

```
MVR Multicast VLAN: 22
```

```
MVR Max Multicast Groups: 256
```

```
MVR Current Multicast Groups: 1
```

```
MVR Timeout: 180 (second)
```

```
MVR Mode: dynamic
```

To view MVR group address configurations:

```
Raisecom#show mvr members
```

```
MVR Group IP      Status      Members
```

```
-----  
234.5.6.7        Inactive    none
```

14.3.4.3 MVR port information configuration

Under default situation, ports on switch are neither receiving port, nor source ports. User can configure them under interface configuration mode:

Step	Command	Description
1	config	Enter global configuration mode
2	mvr	enable MVR
3	interface port 3	Enter interface configuration mode
4	mvr	Enable interface MVR
		Mvr type configuration:
5	mvr type {source receiver}	<i>source</i> : uplink port can be configured as source port for receiving multicast data, this port cannot be connect directly to subscribers, all source ports should belong to multicast VLAN. <i>receiver</i> : configured as to connect subscribers straightforward, cannot belong to multicast VLAN.
6	mvr vlan vlanid group ip-address	Optional, set the port to join multicast group statically. Under compatible mode, this command can applied to receiving port, and can be applied to source port or receiving port dynamically.

7	mvr immediate	Enable automatic leaving function on this port, this command can be only applied on receiving port
8	exit	Back to global configuration mode
9	exit	Back to privileged EXEC mode
10	show mvr	Show MVR configuration status
11	show mvr port [portid]	Show port mvr configuration information
12	show mvr port [portid] members	Show port member information

To set port MVR configuration back to default status, you can use command **no mvr [type | immediate | vlan vlan-id group]**. Use command **no mvr vlan vlan-id group** to delete all static multicast group, you can specify a multicast address if you want to delete only one group. The example below shows how to configure port 3 as MVR receiving port, and how to enable intermediate leaving function and how to join into the static multicast group:

```
Raisecom#config
```

```
Raisecom(config)#inter port 3
```

```
Raisecom(config-port)#mvr
```

```
Raisecom(config-port)#mvr type receiver
```

```
Raisecom(config-port)#mvr immediate
```

```
Raisecom(config-port)#mvr vlan 1 group 234.5.6.7
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

To check if the configurations are correct, use command **show**:

```
Raisecom#show mvr port 3
```

```
Running: Enable
```

```
Type: Receiver
```

```
Status: Inactive/down
```

```
Immediate Leave: Enable
```

```
Raisecom#show mvr port 3 members
```

```

MVR Group IP    Type    Status
-----
234.5.6.7      static  Inactive

```

14.3.5 MVR monitoring and maintaining

You can use some “show” commands to view the MVR running status and configurations for the switch in which way you can achieve a better monitor and maintenance:

Command, mode	Commands below need to run under ENABLE mode
---------------	--

show mvr	Show MVR global configuration information
show mvr members	show MVR group information
show mvr port [portid]	show MVR port configuration information
show mvr port portid members	Show MVR static or dynamic group information

Show MVR global configuration information

Raisecom#**show mvr**

```

MVR Running: Enable
MVR Multicast VLAN: 1
MVR Max Multicast Groups: 256
MVR Current Multicast Groups: 0
MVR Timeout: 600 (second)
MVR Mode: Compatible

```

Show MVR group information

Raisecom#**show mvr members**

```

MVR Group IP      Status      Members
-----
234.5.6.7         Active      1
234.5.6.8         Active      1
234.5.6.9         Inactive   None
234.5.6.10        Inactive   None

```

Show MVR port configuration information

Raisecom#**show mvr port**

```

Port   Running  Type           Status           Immediate Leave
-----
1      Enable   Receiver       Inactive/down   Enable
2      Disable  Non-MVR        Inactive/down   Disable
3      Disable  Non-MVR        Inactive/down   Disable
4      Disable  Non-MVR        Inactive/down   Disable
5      Disable  Non-MVR        Inactive/down   Disable
6      Disable  Non-MVR        Inactive/down   Disable
7      Disable  Non-MVR        Inactive/Up     Disable
.....
25     Disable  Non-MVR        Inactive/down   Disable
26     Disable  Non-MVR        Inactive/down   Disable

```

To show designated port information:

Raisecom#**show mvr port 1**

Running: Enable

Type: Receiver

Status: Inactive/down

Immediate Leave: Enable

Show MVR port group information

Raisecom#**show mvr port 1 members**

<i>MVR Group IP</i>	<i>Type</i>	<i>Status</i>
234.5.6.7	<i>static</i>	<i>Inactive</i>
234.5.6.8	<i>static</i>	<i>Inactive</i>

14.3.6 Configure MVR Proxy

This part is about how to configure MVR proxy on the switch, including:

- ✧ Default MVR proxy configuration
- ✧ Configure MVR proxy
- ✧ MVR proxy monitoring and maintaining

14.3.6.1 Default MVR proxy configuration

Feature	State
Message compress function	disable
Querier function	disable
MVR proxy source IP address	Use the IP address of IP port 0, if IP port 0 is not configured, use 0.0.0.0
Query time interval	60s
The maximum responding time of sending query message	10s
The last member sending query interval	1s

14.3.6.2 MVR Proxy configuration

By default, MVR proxy is off on the switch. In global configuration mode use the following commands to activate MVR proxy configuration. You can also set source IP address, query time interval, the maximum responding time of sending query message, the last member sending query interval. If MVR proxy is not started, configuring MVR proxy is allowed, and once MVR proxy is started, these configurations will take

effect immediately.

Step	Command	Description
1	config	Enter global configuration mode
2	mvr proxy	Start MVR proxy function. When it is started, MVR message compress function and MVR querier function will be started at the same time.
3	mvr proxy suppression	Start message compress function
4	mvr proxy querier	Start querier function
5	mvr proxy source-ip <i>A.B.C.D</i>	Optical, the given MVR proxy packet source IP address. If not configured use the IP address of IP port 0, if IP port 0 is not configured, use 0.0.0.0
6	mvr proxy query-interval <i>seconds</i>	Optical, set the querier query time interval. Default value is 60s, range is 10-65535
7	mvr proxy query-max-response-time <i>seconds</i>	Optical, set the maximum responding time of query message. Default value is 10s, range is 1-25
8	mvr proxy last-member-query <i>seconds</i>	Optical, configure the last member sending query interval, default value is 1s, range is 1-25

To stop MVR proxy, in global configuration mode run command **no mvr proxy** to disable message compress and querier function. In global configuration mode use **no mvr proxy suppression** and **no mvr proxy querier** to disable message compress and querier function respectively. To restore other configurations to default value, use **no mvr proxy {source-ip | query-interval | query-max-response-time | mvr proxy last-member-query}**.

The following example shows how to start MVR proxy, set the source IP to 192.168.0.1, query interval 100s, query message maximum responding time 20s, the last member sending query interval 5s.

```
Raisecom (config)# mvr proxy
Raisecom (config)# mvr proxy source-ip 192.168.0.1
Raisecom (config)# mvr proxy query-interval 100
Raisecom (config)# mvr proxy query-max-response-time 20
Raisecom (config)# mvr proxy last-member-query 5
```

Use command **show** to examine if the configuration is correct:

```
Raisecom # show mvr proxy
Mvr proxy suppression status:          enable
Mvr proxy querier status:              enable
Mvr proxy source ip:                   192.168.0.1
Mvr proxy version:                     V2
Mvr query interval(s):                 100
Query Response Interval(s):            20
Last Member Query Interval(s):         5
Next IGMP general query(s):           5
```

14.3.7 MVR Proxy monitoring and maintenance

Use the commands below to show MVR proxy configuration and port MVR static.

Command	Description
show mvr proxy	Show MVR proxy configuration
show mvr port [<i>portid</i>] statistics	Show port MVR static
clear mvr port [<i>portid</i>] statistics	Clear port static information

Show MVR proxy configuration:

Raisecom # **show mvr proxy**

```
Mvr proxy suppression status:          enable
Mvr proxy querier status:              enable
Mvr proxy source ip:                   192.168.0.1
Mvr proxy version:                      V2
Mvr query interval(s):                 100
Query Response Interval(s):            20
Last Member Query Interval(s):         5
Next IGMP general query(s):            5
```

Show port MVR static

Raisecom # **show mvr port statistics**

```
Port 1:
Received query packets: 10
Received report packets: 10
Received leave packets: 10
Drop query packets: 10
Drop report packets: 10
Drop leave packets: 10
Last replace new multicast address: 224.1.1.1
Last replace old multicast address: 224.2.2.2
Total replace count: 5
```

```
Port 2:
Received query packets: 10
Received report packets: 10
Received leave packets: 10
Drop query packets: 10
Drop report packets: 10
Drop leave packets: 10
```

Last replace new multicast address: 224.1.1.1

Last replace old multicast address: 224.2.2.2

Total replace count: 5

.....

14.3.8 IGMP filter configuration

This part is about how to configure IGMP filter on the switch, including:

- ✧ Default IGMP filter configuration
- ✧ IGMP profile configuration
- ✧ Use IGMP profile

14.3.8.1 Default IGMP filter configuration

Feature	state
IGMP filter enable/disable	Enabled
Port application	No application
Maximum group	No limit
Maximum group action	Reject
IGMP profile	Not defined
IGMP profile action	reject

14.3.8.2 IGMP profile configuration

Use command **ip igmp profile** under global configuration mode, you can create IGMP profile and enter profile configuration mode. Parameters such as range, actions and etc. can be configured under this mode.

Step	Command	Description
1	config	Enter global configuration mode
2	ip igmp profile <i>profile-number</i>	Create profile and enter profile configuration mode, series number of profile is from 1 to 65535.
3	permit deny	Optional, actions configuration including permit or deny multicast group access, the default status is deny.
4	range <i>start-ip</i> [<i>end-ip</i>]	IP multicast address or address range

configurations. If inputting address range, the starting address, blanks and ending address should be within the group address.

5	exit	Back to global configuration mode
6	exit	Back to privileged EXEC mode
8	show ip igmp profile [<i>profile-number</i>]	Show IGMP profile configuration information

To delete profile, carry out **no ip igmp profile** under global configuration mode. To delete a multicast address of profile, use command **no range start-ip**.

The example below shows how to create profile 1 and configure single multicast address:

```
raisecom(config)# ip igmp profile 1
raisecom (config-profile)# range 234.5.6.7
raisecom (config-profile)# range 234.5.6.9
raisecom (config-profile)# permit
raisecom (config-profile)#exit
raisecom (config)#exit
```

To check if the configurations are correct, use command show:

```
Raisecom#show ip igmp profile 1
IGMP profile 1
permit
range 234.5.6.7
range 234.5.6.9
```

14.3.8.3 Applying IGMP filter under interface

Use command **ip igmp filter** under interface configuration mode to apply the created IGMP profile on a specified port. One IGMP profile can be applied to multiple ports, but one port can have only one IGMP profile.

Step	Command	Description
1	config	Enter global configuration mode
2	interface port 1	Enter interface mode
3	ip igmp filter <i>profile-number</i>	Apply IGMP profile on the port
4	ip igmp max-groups <i>group-number</i>	Set the maximum number of the groups that is allowed for entry
5	ip igmp max-groups action { <i>deny replace</i> }	The action taken when the group number on the port exceeds the maximum group number
6	exit	Return to global configuration mode

7	exit	Return to privileged EXEC mode
8	show ip igmp filter port [portid]	Show the IGMP profile applied on the port

To cancel applying IGMP profile, use command **no ip igmp filter** under interface configuration mode. If no IGMP profile is applied to port, no result will be shown.

The example below shows how to apply IGMP profile 1:

```
raisecom(config)# interface port 1
raisecom (config-port)# ip igmp filter 1
raisecom (config-port)#exit
raisecom (config)#exit
```

To check if the configurations are correct, use command **show**:

Raisecom#**show ip igmp filter port**

<i>Port</i>	<i>Filter</i>	<i>Max Groups</i>	<i>Current Groups</i>	<i>Action</i>
1	1	20	0	Deny
2	0	20	0	Deny
3	0	0	0	Deny
.....				
25	0	0	0	Deny
26	0	0	0	Deny

To view port 1 information:

Raisecom#**show ip igmp filter port 1**

```
IGMP Filter: 1
Max Groups: 20
Current groups: 0
Action: Deny
```

14.3.8.4 Applying IGMP filter under VLAN

By default, there is no IGMP filter applying rules under VLAN, no maximum group limit, the maximum group action is deny. Follow the steps below in global configuration mode to configure the applied filter rules under VLAN, maximum group limit and maximum action.

Step	Command	Description
1	config	Enter global configuration mode
2	ip igmp filter profile vlan vlanlist	Specify the defined filter rules on VLAN. The

		applied filter rule number should have been created, or the configuration fails. Vlanlist range is 1-4094.
3	ip igmp max-group max-group vlan vlanlist	Set the maximum group number on specified VLAN. The configured maximum group number must be no larger than the maximum group number that the equipment supports
4	ip igmp max-group action {deny/replace} vlan vlanlist	Configure the maximum group action the specified VLAN, default value is 'deny'.
5	exit	Return to privileged EXEC mode
6	show ip igmp filter vlan [vlanid]	Show the configured filter information under VLAN.
7	config	Enter global configuration mode
8	ip igmp filter profile vlan vlanlist	Specify the defined filter rules on VLAN. The applied filter rule number should have been created, or the configuration fails. Vlanlist range is 1-4094.

Use **no ip igmp filter vlan vlanlist** to delete the configured filter rules under VLAN, use **no ip igmp max-group vlan vlanlist** to delete the configured maximum group limit under VLAN.

The following example shows how to apply filter rules under VLAN and configure the maximum group limit and maximum group action:

```
Raisecom (config)# ip igmp filter 1 vlan 1
Raisecom (config)# ip igmp max-group 10 vlan 1
Raisecom (config)# ip igmp max-group action replace vlan 1
```

Use the command **show** to examine if the configuration is correct

```
Raisecom # show ip igmp filter vlan 1
      VLAN  Filter    Max Groups    Current Groups  Action
-----
      1      1       10           0                Replace
```

14.3.9 IGMP filter monitoring and maintenance

Use some **show** commands to show the switch IGMP filter running state and configuration state for monitoring and maintenance. Use the following **show** commands to do IGMP filter monitoring and maintenance:

Command	Description
show ip igmp filter	Show IGMP filter global configuration information
show ip igmp profile [profile-number]	Show IGMP profile information
show ip igmp filter port [portid]	Show IGMP filter port configuration information
show ip igmp filter vlan [vlanid]	Show the IGMP filter rules configuration under specified VLAN. When vlanid is not specified, show the configuration state of VLAN that have been configured filter rules.

14.3.10 Typical configuration example

14.3.10.1 MVR typical configuration example

PC or TV set-top box can receive multicast traffics, one or multiple PC or televisions can connect to a receiving port called subscriber. When selecting scheduled programs, set-top or PC sends IGMP report information to join a group. If IGMP report matches to the configured multicast addresses on the switch, the CPU on the switch will modify the multicast switch table in the hardware, and add this port to the multicast VLAN group. When the source port receives the multicast traffic, it will send the traffic to the receiving ports according to the multicast forwarding table in the hardware.

When switching channels or shutting down the TV, the set-top box or PC will send IGMP leaving information, then the switch will forward this information to the multicast router, the router will send IGMP query information, if there is no other member in this group, the switch will delete this port from the group.

If enabling immediate leaving function on the receiving port, port will leave the group faster. If the immediate leaving function is not enabled yet, when the receiving port receives IGMP leaving information, the switch will forward router's IGMP query information and wait IGMP member report. If no report is received within the maximum query time, the member will be deleted from the group. If enabling the immediate leaving function, port member will be deleted as soon as it receives IGMP leaving information. This feature is normally used in the situation that one port is connected to only one user.

Multicast traffic will not be transmitted in all VLANs, but only need to be transmitted in multicast VLAN. Use can save much bandwidth in this way.

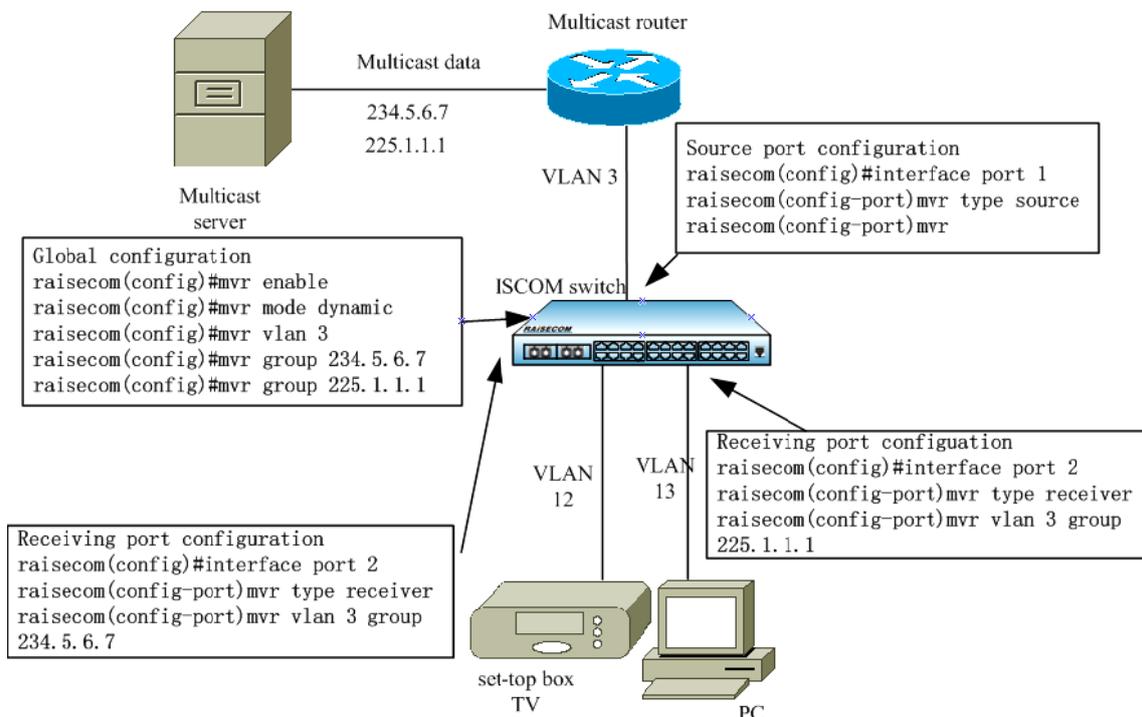

Fig 3-1 MVR application topology

14.3.10.2 MVR proxy typical configuration example

Enable MVR proxy on ISCOM switch: configure port 1 to source port, port 2 and 3 to receive port. In the figure below, when PC and set-top box join the same multicast group, the switch will receive two IGMP report messages, and send only one IGMP report message to the multicast router. The IGMP query message sent from multicast router will no longer transmit to downstream, but send IGMP query message by the switch periodically.

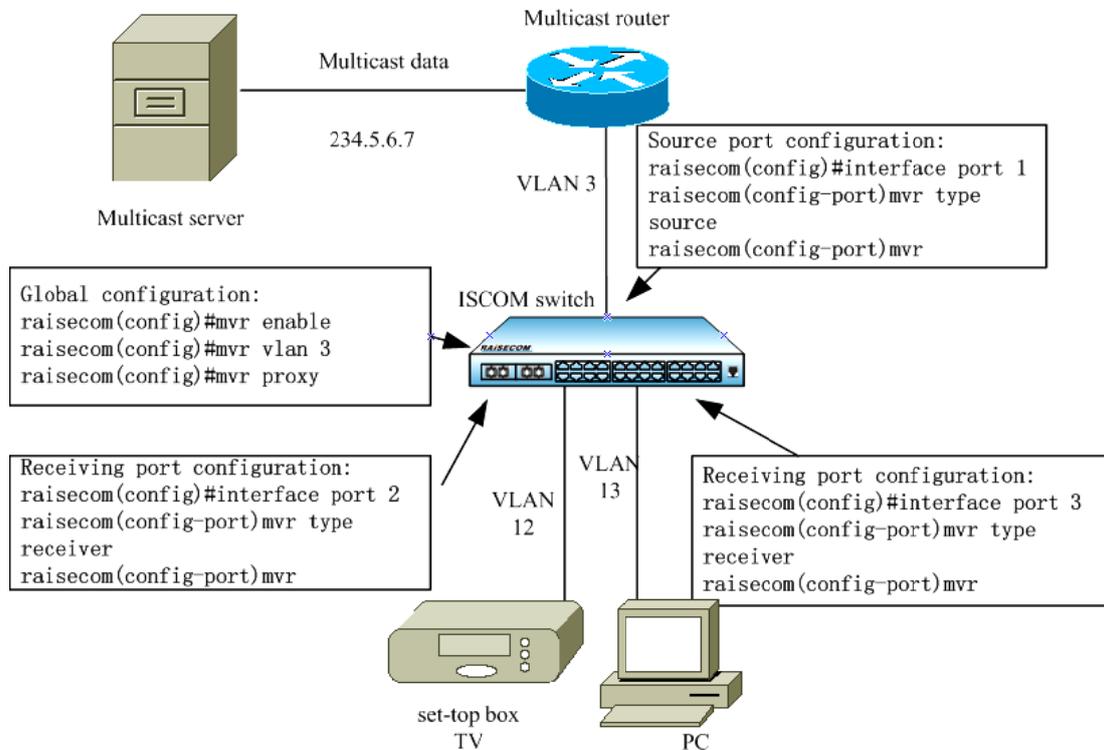

Fig 3-2 MVR proxy application topology

14.3.10.3 IGMP filter under VLAN typical configuration example

Enable IGMP filter on the switch, establish filter rule profile 1, and set address range from 234.5.6.7 to 234.5.6.10, the action is set to allow. According to the IGMP filter rule under VLAN 12, PC and set-to box can both enter the multicast group 234.5.6.7, PC can join the multicast group 234.5.6.11 while set-top box can not. According to the maximum group limit of VLAN 12, after set-top box enter 234.5.6.7, if it enter 234.5.6.8, it will quit from the multicast group 234.5.6.7 before.

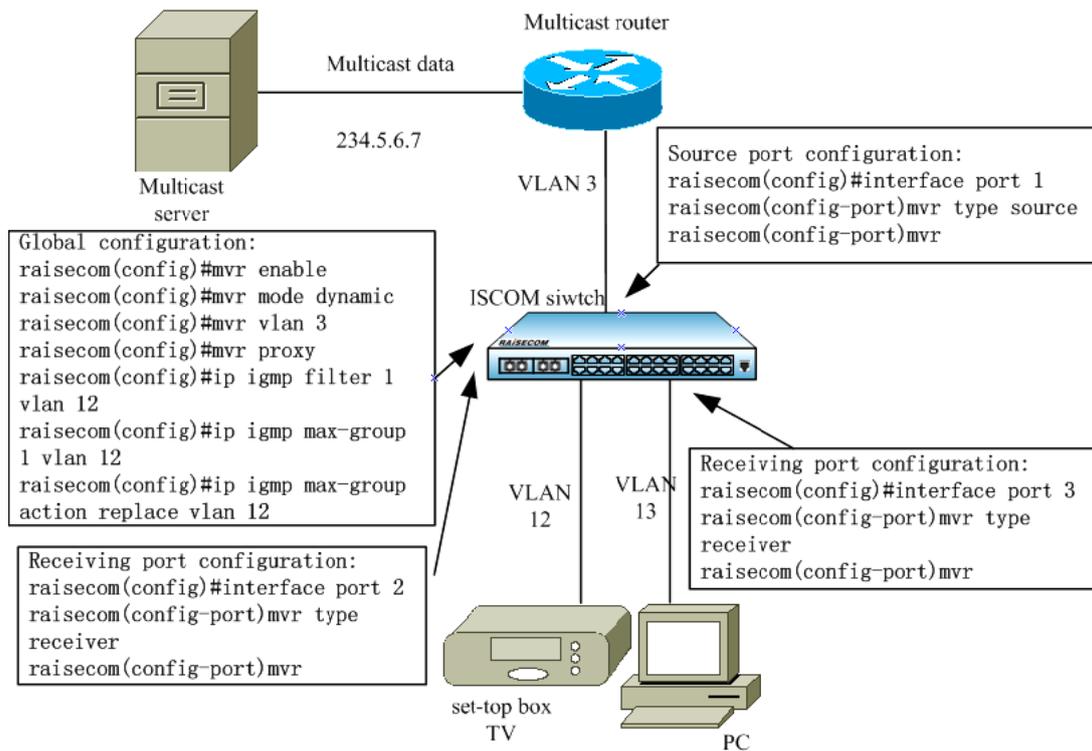

Fig 3-3 the IGMP filter application topology under VLAN

14.3.10.4 The IGMP filter under port typical configuration example

Enable IGMP filter on the switch, establish filter rule profile 1, and set address range from 234.5.6.7 to 234.5.6.10, the action is set to allow. According to the IGMP filter rule under port 2, PC and set-to box can both enter the multicast group 234.5.6.7, PC can join the multicast group 234.5.6.11 while set-top box can not. According to the maximum group limit of port 2, after set-top box enter 234.5.6.7, if it enter 234.5.6.8, it will quit from the multicast group 234.5.6.7 before.

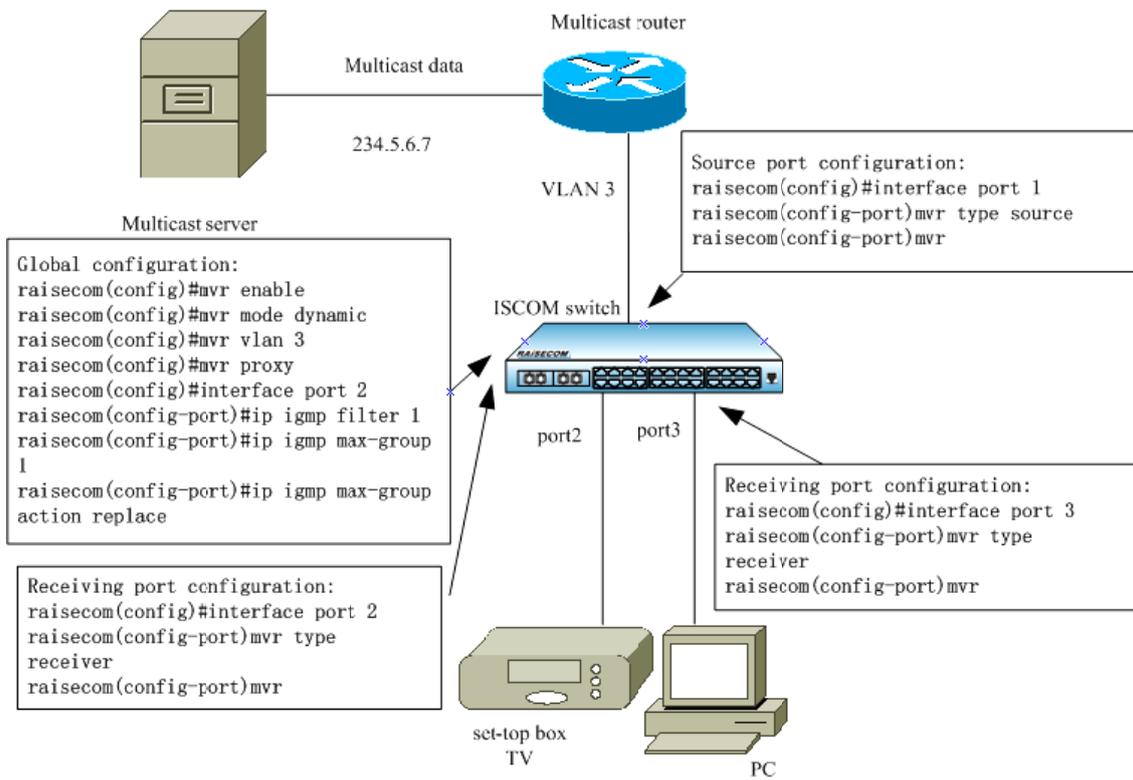

Fig 3-4 the IGMP filter application topology under port

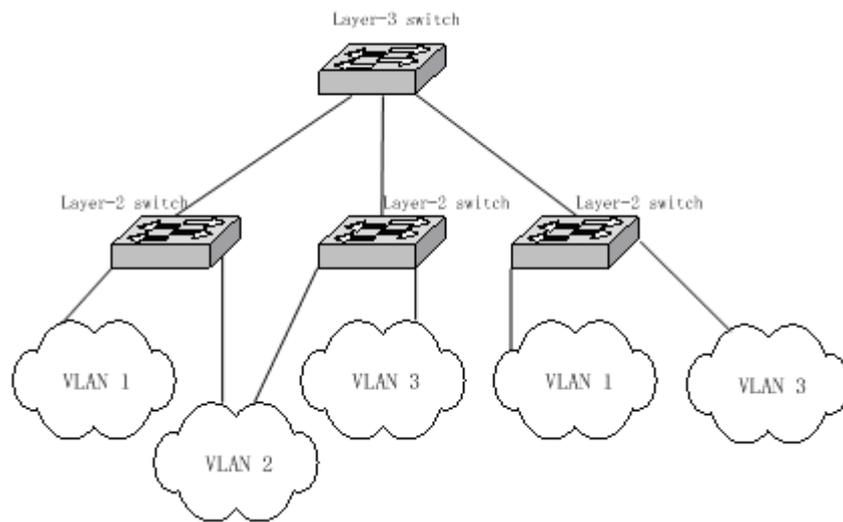

14.3.11 MVR, MVR Proxy and IGMP filter trouble shooting

1. When configuring source port, it is not within multicast VLAN;
2. When configuring receive port, it is in multicast VLAN;
3. When configuring MVR group, the group addresses conflict because several IP multicast addresses suit one MAC multicast address;
4. When configuring stable group on the port, the address is not within MVR range;
5. In MVR compatible mode, configure stable multicast on source port.

15.1 VLAN Principle

15.1.1 IEEE802.1Q VLAN

VLAN stands for virtual LAN (virtual Local Area Networks). In terms of functions, VLAN has the same characteristics with LAN. However, VLAN members are not restricted by physical locations. For instance, the users connected to the same switch can belong to different VLANs. The broadcast domain and multicast domain are both in reference to VLAN member, multicast, broadcast and unicast will not flood to other VLANs. Different VLANs can communicate with each other only via Layer-3 switch or router. The features above offer much convenience for network management, user can allocate VLANs based on functions in the network so as to promote the network bandwidth utility and security. A typical VLAN network topology is shown below:

VLAN, a protocol to handle the Ethernet problems from broadcasting and safety, is added VLAN port based on Ethernet frame, divides users into smaller working group using VLAN ID and limits the two-layer visit between users within different working groups. Each working group is a virtual LAN.

In 1999 IEEE issues the 802.1Q protocol standard draft for VLAN realization project. As the criterion of VLAN, it encapsulates VLAN ID in the frame header, so that the VLAN information can be kept when a frame is crossing different equipments. The switches of different producers can be under unified management and cross switches if only they support 802.1Q VLAN.

15.1.2 VLAN Mapping interview

VLAN Mapping can modify VLAN Tag in the message, and supports the following two mapping relationships:

- 1: 1VLAN Mapping: change the VLAN ID in VLAN Tag taken by a message into another VLAN ID.
- 2: 2VLAN Mapping: add out-layer VLAN Tag to the message with one layer VLAN Tag, so that the message can take two layer VLAN Tag.

15.1.3 Q-IN-Q interview

In the framework of IP data network, the switch is used as access equipment, when LAN is used as the

access process, to divide users for user's data safety becomes a serious problem.

Now many producers demands end to end safety recognition, hoping each user can allocated a VLAN, but the problem is that there are only 4096 standard VLAN resources. However, using the innovative Q-in-Q technology, the limit of 4096 VLAN can be broken through in metro Ethernet assembly, which not only extends the ability of creating two-layer network using VLAN, but also realizing metro network two-layer VPN, that is suitable for metro network and WAN services.

Q-in-Q technology is a simple and flexible two-layer VPN technology. Using outer-layer VLAN Tag to encapsulate outer-layer VLAN Tag for user's private network message in carrier's access end, it can let the message carry two-layer VLAN Tag to cross carrier's backbone network (public network). Inner layer VLAN Tag is user private network VLAN Tag, outer layer VLAN Tag is the one that carrier allocates to user. In public network, messages transmit only according to the outer layer VLAN Tag, and the source MAC address table item of the messages is learned and copied to the MAC address table of the VLAN that outer layer Tag is in, while user's private network VLAN Tag will be taken as the messages' data part for transmission.

The basic working principle and method of Q-in-Q: when the data is transmitting in private network it has a private network mark, defined as CVLAN Tag; when entering the backbone network of facilitator, public network VLAN Tag will be added to it, defined as SPVLAN Tag (or Outer tag); when reaching destination private network the SPVLAN Tag of the public network will be deleted to offer user a relatively simple two-layer VPN tunnel. SPVLAN Tag is embedded after Ethernet source MAC address and destination MAC address, which also contains a 12 bits SPVLAN ID that supports 4096 VLAN. SPVLAN CoS domain contains 3 bits, supports 8 priority. In the network based on Q-in-Q, the operator allocates a SPVLAN ID for each VLAN, then maps user's CVLAN ID to these SPVLAN ID. Thus, user's C-VLAN ID can be protected.

15.2 Switch VLAN Function Configuration

15.2.1 VLAN based on port

VLAN division based on port is the most simple and effective way for VLAN division. It defines VLAN member according to the equipment port, and when the given port enters the given VLAN, it can transmit messages from the given VLAN

15.2.1.1 VLAN port mode interview

Port member mode	VLAN member attributes
Access	Under this mode, the port can be allocated to a single VLAN, packet sent from Access port does not have no 802.1Q tag, Access ports within different VLANs cannot communicate with each other.
Hybrid	Under this mode, the port can be allocated to multiple VLANs, you can also determine if packet sent out from Hybrid port carries related 802.1Q tag or not. Meanwhile, you can also classify the non-802.1Q packets that enter the port into different VLANs by setting the Native attribute of the port.
Trunk	Trunk port can be allocated with different VLANs by default, packet forwarded from it carries 802.1Q tag expect for Native VLAN. However, you can limit the packets through which VLAN they are forwarded by using <i>allowed vlans</i>

Dot1q-tunnel	TUNNEL port mode can only be designated to one VLAN by user, the data packet transmitted from TUNNEL port do not contain out layer TAG, TUNNEL port of different VLAN can not interflow. The data packet entered from TUNNEL port can be added two layer TAG.
Trunk double-tagging	Configure port to TRUNK mode, and enable the port the ability of recognizing and handling out layer TAG (that is SP VLAN TAG).
Hybrid dot1q-tunnel	Configure the port to HYBRID mode, enable the port the ability of adding outer layer TAG (that is SP VLAN TAG) for the packet entering the port (ignoring the out-layer/inner-layer TAG in the data packet)

15.2.1.2 Default VLAN configuration

Function	Default value
Create stable VLAN	There are default VLAN and cluster VLAN in the system, that is VLAN 1 and VLAN 2, all the ports exists in VLAN 1 in access mode
VLAN name	The default system VLAN (VLAN 1) is 'Default', cluster VLAN name is 'Cluster-Vlan', other stable VLAN name is 'VLAN' adding VLAN ID(four figures number)
Configure the activity state of stable VLAN	The new created stable VLAN activity state is suspend.
Configure the port mode	Access
Configure the VLAN number that is allowed to pass in HYBRID mode	All VLAN
Configure the VLAN number that is allowed to pass in TRUNK mode	VLAN1
Configure Native VLAN for Trunk, Hybrid port	VLAN1
VLAN filtration attribute	Enable
Port protection	The port is not protected port
Transmission port list	All the other ports except its own port
VLAN priority	No priority

15.2.1.3 Configure VLAN Attribute

VLAN attribute configuration includes the VLAN configuration of creation, deletion, name and activity state. The configuration steps are as follows:

Step	Command	Command parameter explain
1	config	Enter global configuration mode
2	create vlan {2-4094} (active suspend) priority {0-7}	Create VLAN and make sure the state: active/suspend 0-7: VLAN priority {2-4094}: VLAN ID

3	vlan <1-4094>	Create VLAN and enter the configuration mode <1-4094> VLAN ID Dominate VLAN
4	name WORD	WORD VLAN name, no longer than 15 characters
5	state {active suspend}	Configure VLAN state: active/suspend
6	exit	Return to global configuration mode
7	exit	Return to privileged EXEC mode
8	show vlan	Show VLAN configuration

Use **no vlan** <2-4094> to delete VLAN.

Notice:

- The new created VLAN using VLAN <1-4094> is in suspend state, if user wishes to activate it in the system, the command **state** that would be introduced later is needed to activate VLAN.
- By default there are VLAN existed in the system, that is default VLAN (VLAN 1) and cluster VLAN (VLAN 2), all the ports are Access mode belongs to the default VLAN. VLAN priority range is 0-7.
- The new created VLAN, has no priority by default, is shown as N/A. VLAN priority range is 0-7.
- By default, default VLAN (VLAN 1) name is 'Default', cluster VLAN (VLAN 2) name is 'Cluster-VLAN', other VLAN name is character stream 'VLAN' added four figures VLAN ID. For example, the default VLAN 1 name is 'VLAN0001', the default VLAN 4094 name is 'VLAN4094'.
- All the VLAN configuration can no take effect until the VLAN is activated. When VLAN activity state is suspend, user can still configure the VLAN, like delete/add port, configure VLAN name and so on, the system will keep the configuration, once the VLAN is activated, the configuration will take effect in the system.

15.2.1.4 Configure VLAN priority

By default, when VLAN is created, there is no priority, shown as N/A, the VLAN priority range is 0-7. The configuration steps are as follows:

Step	Command	Command parameter example
1	config	Enter global configuration mode Configure VLAN priority
2	vlan {2-4094} priority <0-7>	{2-4094} VLAN ID <0-7> VLAN priority
3	exit	Return to privileged EXEC mode
4	show vlan	Shown VLAN configuraion

Use **no vlan** {2-4094} **priority** to restore VLAN priority to default state, or VLAN without priority.

15.2.1.5 Configure port VLAN mode

Each mode and the configuration is shown below:

1. Configure port VLAN mode

Port VLAN mode configuration must be done in physical interface configuration mode, the steps are as

follows:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter the corresponding physical port configuration mode <i>portid</i> : port number
		Configure port VLAN mode
		access ACCESS mode, that is port exists in the unique VLAN in the form of UNTAG;
		hybrid HYBRID mode, port can exist in several VLAN in both UNTAG or TAG mode
	switchport mode { <i>access</i> / <i>hybrid</i> [<i>double-tagging</i>] / <i>trunk</i> [<i>double-tagging</i>] / [<i>hybrid</i>] <i>dot1q-tunnel</i> }	hybrid double-tagging Configure the port to HYBRID mode, and enable the port the ability of recognizing and handing outer layer Tag (or SP VLAN Tag)
3		hybrid dot1q-tunnel configure the port to HYBRID mode, and enable the port the ability of compulsively adding outer layer Tag (or SP VLAN Tag) for the packets.
		trunk TRUNK mode, port exists in several VLAN in TAG mode, and exists in Native Vlan in UNTAG mode.
		trunk double-tagging configure the port to TRUNK mode so that it is able to recognize and handle outer layer Tag (or SP VLAN Tag)
		dot1q-tunnel TUNNEL mode, the data packet enters from this port can be added double Tag
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface port [<i>port-list</i>] switchport	Show port VLAN attribute configuration

Use **no switchport mode** to restore port VLAN mode to default value, that is port VLAN mode is Access mode.

2. Configure Access, dot1q-tunnel port Access VLAN, the steps are as follows:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter physical port configuration mode
3	switchport access vlan <1-4094>	Configure VLAN that is allowed to pass Hybrid port
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface port [<i>port-list</i>] switchport	Show port VLAN attribute configuration

Use **no switchport access vlan** command to restore Access VLAN to default value, or port Access VLAN is VLAN 1.

3. Configure VLAN that is allowed to pass through Hybrid port ,the steps are as follows:

Step	Comamnd	Description
1	config	Enter global configuration mode
2	interface port <1-26>	Enter the corresponding physical port configuration mode
3	switchport hybrid allowed vlan { all <i>vlan-list</i> add <i>add-vlan-list</i> remove <i>remove-vlan-list</i> }	Configure the allowed VLANs for the Hybrid port
		All: allow all vlan
4	switchport hybrid untagged vlan { all <i>vlan-list</i> add <i>add-vlan-list</i> remove <i>remove-vlan-list</i> }	vlan-list: allow all VLAN, rewrite the primary configuration
		Add: add-vlan-list: add vlan base on the existent vlan Remove: remove-vlan-list, remote vlan base on the existent vlan
5	exit	Back to global configuration mode
6	exit	Back to privileged EXEC mode
7	show interface port [{1-26}] switchport	Show the port VLAN attributes configuration

Use **no switchport hybrid allowed vlan** to restore Hybrid port allowed VLAN to default value, that is, all the VLAN is allowed to pass.

Use **no switchport hybrid untagged vlan** to restore Hybrid port allowed Untagged VLAN to default value, that is, only VLAN is allowed to pass.

4. Configure VLAN that is allowed to pass Trunk port, the steps are as follows:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter corresponding physical port configuration mode
3	switchport trunk allowed vlan { all <i>vlan-list</i> add <i>add-vlan-list</i> remove <i>remove-vlan-list</i> }	Configure the allowed VLAN for the Trunk port
		All: allow all vlan
		vlan-list: allow all VLAN, rewrite the primary configuration
		Add:

		add-vlan-list: add vlan base on the existent vlan
		Remove: remove-vlan-list, remote vlan base on the existent vlan
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface port [port-list] switchport	Show port VLAN attribute configuration

Use **no switchport trunk allowed vlan** to restore Trunk port allowed VLAN list to default value, that is, all the VLAN.

5. Configure Native VLAN of Trunk and Hybrid port, the steps are as follows:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	interface port portid	Enter corresponding physical port configuration mode
3	switchport native vlan <1-4094>	Configure Native VLAN of Trunk and Hybrid port
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface port [port-list] switchport	Show port VLAN attribute configuration

Use **no switchport native vlan** to restore Native VLAN of Trunk and Hybrid port to default value, or VLAN1.

15.2.1.6 VLAN filtration enable/disable function

The configuration of VLAN filtration enable/disable function is shown below:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	interface port portid	Enter corresponding physical port configuration mode
3	switchport ingress-filtering (enable/disable)	Configure port VLAN filtration attribute : enable/disable
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface port [port-list] switchport	Show port VLAN attribute configuration

15.2.1.7 Configure port protection

The configuration steps are as follows:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter corresponding physical port configuration mode
3	switchport protect	Configure the physical port to protected port Protect the protected port
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface port protected	Show physical port protection attribute

Use **no switchport protect** to cancel port protection configuration.

15.2.1.8 Configure port transmission

By default, the port can transmit messages to other ports except its own one, port transmission function supports port list configuration under port, so that the range of the ports that are able to transmit messages can be confined.

To configure transmission port, you need to enter the given port or port range mode, the corresponding commands are as follows:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter port mode
3	switchport forwarding allowed portlist <i>port-list</i>	Configure transmission list under port <i>Port-list</i> : port list
4	exit	Quit from interface mode
5	exit	Quit from global configuration mode
6	show interface port [<i>port-list</i>] switchport	Show port transmission list

Use **no switchport forwarding allowed portlist** to restore port transmission list to default value, that is, all the ports except its own one.

15.2.1.9 Monitoring and maintenance

Command	Command parameter introduction
show interface port [<i>port-list</i>] switchport	Show port VLAN attribute configuration
show interface port protected	Show physical port protection attribute
show vlan	Show port VLAN attribute configuration

15.2.1.10 Typical configuration example

The topology structure is shown below:

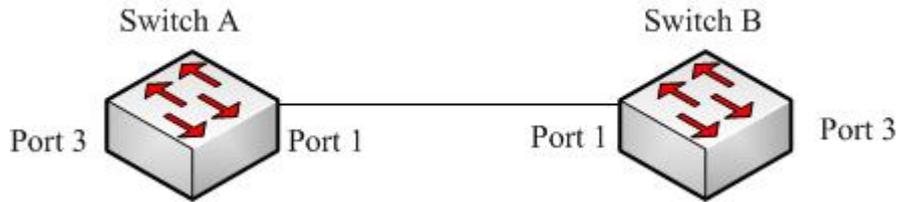

Fig 1 topology structure

As is shown in figure 1, the SwitchA and SwtichB use Port1(SwtichA) and Port1(SwtichB) to connect each other, configure Port1 of the two equipments to Trunk port, allowVLAN1-VLAN100 to pass, Port3(SwtichA) and Port3(SwtichB) are Access port, Access VLAN is VLAN6. The configuration of SwitchA and SwitchB are totally the same, now SwitchA configuration will be shown.

SwitchA configuration is as follows:

```
Raisecom#config
```

```
Raisecom(config)#vlan 6
```

```
Raisecom(config-vlan)#state active
```

```
Raisecom(config-vlan)#exit
```

```
Raisecom(config)#interface port 1
```

```
Raisecom(config-port)#switchport mode trunk
```

```
Raisecom(conifg-port)#switchport trunk allowed vlan 1-100
```

```
Raisecom(config-port)# exit
```

```
Raisecom(config)#interface port 3
```

```
Raisecom(config-port)#switchport mode access
```

```
Raisecom(config-port)# switchport access vlan 6
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show vlan
```

```
Outer TPID: 0x9100
```

<i>VLAN</i>	<i>Name</i>	<i>Status</i>	<i>VLAN-Priority</i>	<i>Ports</i>
1	Default	active	N/A	1,2,4-26
6	VLAN0006	active	0	3

```
Raisecom#show interface port 1 switchport
```

```
Port 1:
```

```
Administrative Mode: trunk
```

```
Operational Mode: trunk
```

Access Mode VLAN: 1(default)
Tunnel Mode VLAN: 1(default)
Administrative Tunnel Mode OUTER VLANs of vlan mapping: n/a
Operational Tunnel Mode OUTER VLANs of vlan mapping: n/a
Administrative Trunk Allowed VLANs: 1-100
Operational Trunk Allowed VLANs: 1,3-100
Administrative Hybrid Allowed VLANs: 1-4094
Operational Hybrid Allowed VLANs: n/a
Administrative Hybrid Untagged VLANs: 1
Operational Hybrid Untagged VLANs: n/a
Native Mode VLAN: 1(default)
VLAN Ingress Filtering: Enabled
switchport forwarding allowed portlist: n/a

Raisecom#show interface port 3 switchport

Port 3:
Administrative Mode: access
Operational Mode: access
Access Mode VLAN: 6
Tunnel Mode VLAN: 6
Administrative Tunnel Mode OUTER VLANs of vlan mapping: n/a
Operational Tunnel Mode OUTER VLANs of vlan mapping: n/a
Administrative Trunk Allowed VLANs: 1-4094
Operational Trunk Allowed VLANs: n/a
Administrative Hybrid Allowed VLANs: 1-4094
Operational Hybrid Allowed VLANs: n/a
Administrative Hybrid Untagged VLANs: 1
Operational Hybrid Untagged VLANs: n/a
Native Mode VLAN: 1(default)
VLAN Ingress Filtering: Enabled
switchport forwarding allowed portlist: n/a

15.2.2 VLAN mapping function

VLAN mapping offers CVID for message modification, if the equipment has configured the corresponding mapping rules, the new CVID or SVID that has been mapped will do learning and transmission as transmission VLAN.

15.2.2.1 Default VLAN mapping configuration

Function	Default value
Enable/disable port VLAN mapping function	Disable to all

15.2.2.2 Configure VLAN mapping

The steps to enable/disable VLAN mapping function and configure VLAN Mapping rules are shown below:

Step	Command	Command parameter explain
1	config	Enter global configuration mode
2	vlan-mapping <i>vlan-list1</i> to <i>vlan-list2</i>	Configure VLAN mapping rule <i>Vlan-list1</i> the VLAN ID before mapping <i>Vlan-list2</i> the VLAN ID afeter mapping
3	interface port <i>portid</i>	Enter interface configuration mode
4	vlan-mapping <i>{enable disable}</i>	Enable VLAN mapping function <i>Enable</i> enable VLAN mapping <i>Disable</i> disable VLAN mapping
5	exit	Quit from physical port mode
6	exit	Quit from global configuration mode
7	show vlan-mapping	Show VLAN mapping rules
8	show port <i>{all port-list}</i> vlan-mapping	Show all/specified port VLAN mapping function state <i>All</i> : all the ports <i>Port-list</i> : the specified port or port list

Notice:

- If the number relationship of *vlan-list1* and *vlan-list2* is $N(N>1)$ to 1, the command will map several VLAN to one VLAN; if it is N to N , then *vlan-list1* and *vlan-list2* need to be the same in amount in configuration, when doing VLAN mapping the principle of one-one correspondence.
- By default VLAN mapping function is disabled. When VLAN mapping function of the specified port is enabled, the corresponding mapping rule will take effect on the port.

15.2.2.3 Monitoring and maintenance

Command	Command parameter introduction
show interface port [<i>port-list</i>] switchport	Show the transmission list under specified port
show vlan-mapping	Show VLAN mapping rules
show port <i>{all port-list}</i> vlan-mapping	Show all/ the specified ports VLAN mapping function state <i>All</i> : all the ports <i>Port-list</i> : specified port or port list

15.2.2.4 Typical configuration example

The topology structure is shown in figure 2:

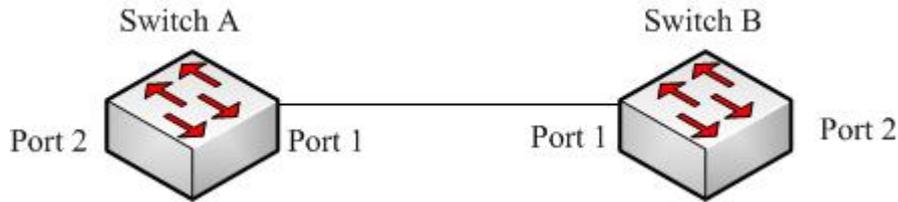

Fig 2 the topology structure

As is shown in figure 2, SwitchA and SwitchB use port 1 for connection, the Port1 and Port2 of the two equipments are both trunk port, create VLAN10-20 and 110-120, map vlan10-20 to vlan110-120, enable VLAN mapping function on Port2. The configuration of SwitchA and SwitchB is totally the same, now SwitchA configuration will be shown.

The configuration of SwitchA:

```
Raisecom#config
Raisecom(config)#create vlan 10-20, 110-120 active
Raisecom(config)# vlan-mapping 10-20 to 110-120
Raisecom(config)#interface port 1
Raisecom(config-port)# switchport mode trunk
Raisecom(config-port)#exit
Raisecom(config)# interface port 2
Raisecom(config-port)# switchport mode trunk
Raisecom(config-port)#vlan-mapping enable
Raisecom(config-port)#exit
Raisecom(config)#exit
Raisecom#show vlan-mapping
```

Global vlan mapping rules:

```
Original VLAN IDs  Translated VLAN IDs
```

```
-----
```

```
10-20              110-120
```

```
Raisecom#show port 1-2 vlan-mapping
```

Vlan Mapping Status:

```
PORT    VLAN-MAPPING STATUS
```

```
-----
```

```
1        disable
```

```
2        enable
```

15.2.3 Basic Q-IN-Q function

15.2.3.1 Default Q-IN-Q configuration

Function	Default value
Configure TPID value of outer layer Tag is HHHH	Default TPID value of outer layer Tag is 0x9100
Configure the port ACCESS VLAN ID	1
Configure port VLAN mode	All the ports exists in ACCESS mode in VLAN1.

15.2.3.2 Basic Q-IN-Q configuration

The steps of configuring Q-IN-Q includes: Tpid, access vlan, tunnel port and double tagging configuration, as is shown below:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	mls double-tagging tpid HHHH	Configure the outer layer Tag TPID value to HHHH; <i>HHHH</i> : hex outer layer Tag TPID value, it is 1~4 figures hex number, range is 0x0-0xFFFF.
3	interface port portid	Enter port mode
4	switchport mode {access hybrid [double-tagging dot1q-tunnel] trunk [double-tagging] dot1q-tunnel [hybrid]}	Configure port VLAN mode access ACCESS mode, port exists in the form of UNTAG in the only VLAN; hybrid HYBRID mode, the port can exist in several VLAN in UNTAG or TAG mode; hybrid double-tagging configure the port to HYBRID mode, so that it can recognize and handle outer layer Tag (SP VLAN Tag); hybrid dot1q-tunnel configure the port to HYBRID mode, can make it enable to compulsively adding outer layer Tag(SP VLAN Tag) for the packet entering the port; trunk TRUNK mode, the port exists in several VLAN in TAG mode, and exists in Native Vlan in UNTAG mode; trunk double-tagging configure the port to TRUNK mode, and enable it the ability to recognize and handle outer layer Tag; dot1q-tunnel TUNNEL mode, the data packet entering the port can be added double Tag.
4	switchport access vlan <1-4094>	Configure the port ACCESS VLAN ID. <1-4094> specific port's ACCESS VLAN ID in ACCESS and DOT1Q-TUNNEL mode.
5	exit	Return to global configuration mode
6	show vlan	Show VLAN configuration
7	show interface port [port-list] switchport	Show port VLAN attribute information

Use **no mls double-tagging tpid HHHH** to restore outer layer Tag TPID to default value:0x9100.

Use **no switchport mode** to restore port VLAN mode to default value, that is ACCESS mode.

Use **no switchport access vlan** mode to restore Access VLAN to default value, that is, port Access VLAN is VLAN 1.

15.2.3.3 Monitoring and maintenance

Command	Command parameter instruction
show vlan [{1-4094}]	Show stable VLAN configuration
show interface port [port-list] switchport	Show port VLAN attribute configuration

15.2.3.4 Typical configuration example

The topology structure is shown in figure 3:

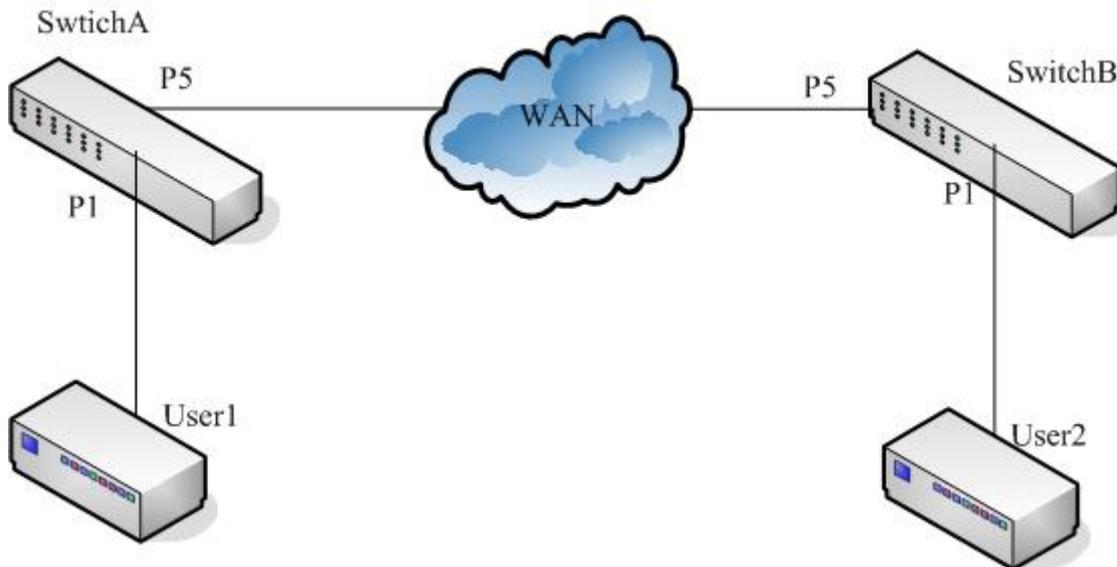

Fig 3 topology structure

As is shown in figure 3, SwitchA and SwitchB are operator's access switches, belong to operator network's VLAN100 and VLAN200 respectively. User1 and User2 are user access equipment, SwitchA use P5 port to connect to MAN (metro area network), p1 port connect of User1, SwitchB use P5 to connect to MAN. P1 connect to User2. MAN TPID is 0x8600. Configure SwitchA and SwitchB to realize QinQ function.

SwitchA configuration is shown below:

```
Raisecom#config
Raisecom(config)#mls double-tagging tpid 8600
Raisecom(config)#interface port 1
Raisecom(config-port)#switchport mode dot1q-tunnel
Raisecom(config-port)#switchport access vlan 100
Raisecom(config-port)#exit
```

Raisecom(config)#**interface port 5**

Raisecom(config-port)#**switchport mode trunk double-tagging**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show interface port 1 switchport**

Port 1:

Administrative Mode: dot1q-tunnel

Operational Mode: dot1q-tunnel

Access Mode VLAN: 100

Tunnel Mode VLAN: 100

Administrative Tunnel Mode OUTER VLANs of vlan mapping: n/a

Operational Tunnel Mode OUTER VLANs of vlan mapping: n/a

Administrative Tunnel Mode OUTER VLANs of vlan mapping: n/a

Operational Tunnel Mode OUTER VLANs of vlan mapping: n/a

Administrative Trunk Allowed VLANs: 1-4094

Operational Trunk Allowed VLANs: 1,100

Administrative Hybrid Allowed VLANs: 1-4094

Operational Hybrid Allowed VLANs: n/a

Administrative Hybrid Untagged VLANs: 1

Operational Hybrid Untagged VLANs: n/a

Native Mode VLAN: 1(default)

VLAN Ingress Filtering: Enabled

switchport forwarding allowed portlist: n/a

SwitchB configuration is shown below:

Raisecom#**config**

Raisecom(config)#**mls double-tagging** *tpid 8600*

Raisecom(config)#**interface port 1**

Raisecom(config-port)#**switchport mode** *dot1q-tunnel*

Raisecom(config-port)#**switchport access vlan** 200

Raisecom(config-port)#**exit**

Raisecom(config)#**interface port 5**

Raisecom(config-port)#**switchport mode** *trunk double-tagging*

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show interface port 1 switchport**

Port 1:

Administrative Mode: dot1q-tunnel

Operational Mode: dot1q-tunnel

Access Mode VLAN: 200

Tunnel Mode VLAN: 200

Administrative Tunnel Mode OUTER VLANs of vlan mapping: n/a

Operational Tunnel Mode OUTER VLANs of vlan mapping: n/a

Administrative Trunk Allowed VLANs: 1-4094

Operational Trunk Allowed VLANs: n/a

Administrative Hybrid Allowed VLANs: 1-4094

Operational Hybrid Allowed VLANs: n/a

Administrative Hybrid Untagged VLANs: 1

Operational Hybrid Untagged VLANs: n/a

Native Mode VLAN: 1(default)

VLAN Ingress Filtering: Enabled

switchport forwarding allowed portlist: n/a

Raisecom# **show interface port 5 switchport**

Port 5:

Administrative Mode: trunk double-tagging

Operational Mode: trunk double-tagging

Access Mode VLAN: 1(default)

Tunnel Mode VLAN: 1(default)

Administrative Tunnel Mode OUTER VLANs of vlan mapping: n/a

Operational Tunnel Mode OUTER VLANs of vlan mapping: n/a

Administrative Trunk Allowed VLANs: 1-4094

Operational Trunk Allowed VLANs: 1,200

Administrative Hybrid Allowed VLANs: 1-4094

Operational Hybrid Allowed VLANs: n/a

Administrative Hybrid Untagged VLANs: 1

Operational Hybrid Untagged VLANs: n/a

Native Mode VLAN: 1(default)

VLAN Ingress Filtering: Enabled

switchport forwarding allowed portlist: n/a

15.2.4 Flexible Q-IN-Q function

15.2.4.1 Default flexible Q-IN-Q configuration

Function	Default value
Configure port flexible Q-IN-Q VLAN mapping relationship	None

15.2.4.2 Configure flexible Q-IN-Q

Flexible Q-in-Q function is to add outer layer TAG according to inner TAG. Configuring port flexible Q-in-Q function must be within physical port configuration mode, the steps are as follows:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter corresponding physical port configuration mode
3	switchport vlan mapping <i>vlan-list</i> add-outer <i>outer-vlan-list</i>	Configure the VLAN mapping relationship of port flexible Q-in-Q <i>vlan-list</i> inner: layer VLAN ID from client network <i>outer-vlan-list</i> : added outer layer VLAN ID
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show vlan mapping	Show all the VLAN mapping configuration
7	show interface port [<i>port-list</i>] switchport	Show port VLAN attribute configuration

Use **no switchport vlan mapping** {all | *vlan-list*} to delete the VLAN mapping relationship of port Q-in-Q.

Notice:

- To ISCOM2924GF/2926, 768 VLAN mapping can be configured at the most.
- The VLAN mapping relationship of flexible Q-in-Q function configure by this command takes effect only on TUNNEL port, that is, only when the interface mode is TUNNEL, can flexible

Q-in-Q function takes effect. The port enters command configured outer layer VLAN in the way of UGTAG, if VLAN do not exist, it will be created automatically. When deleting one Q-in-Q VLAN mapping relationship, if other mapping do not user this outer layer VLAN, delete the port from outer layer VLAN.

15.2.4.3 Monitoring and maintenance

Command	Command parameter instruction
show vlan mapping	Show all the VLAN mapping configuration
show interface port [port-list] switchport	Show port VLAN attribute configuration

15.2.4.4 Typical configuration example

The topology structure is shown below:

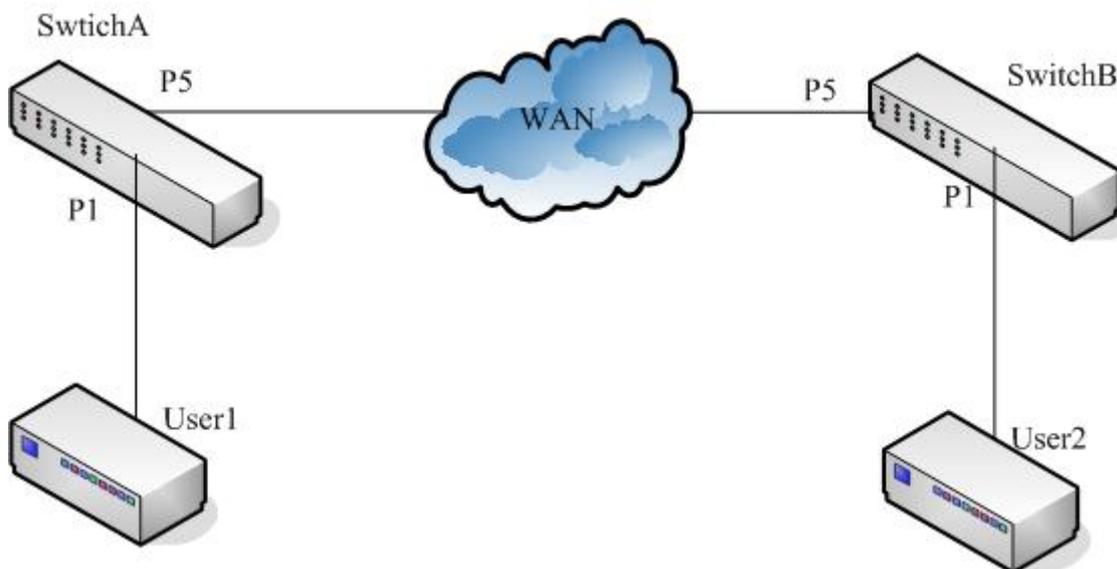

Fig 4 topology structure

As is shown in figure 4, SwitchA and SwitchB are operator access switches, they belong to VLAN 100 and VLAN 200 of the operator's network respectively. User1 and User2 are user access equipments, SwitchA user P5 port to connect to MAN (metro area network), P1 connect to User1, SwitchB connect to MAN using P5, P1 connect to User2. MAN TPID is 0x8600. User1 belongs VLAN10, User2 belong to VLAN20, configure SwitchA and SwitchB to realize flexible Q-in-Q function.

SwitchA configure is shown below:

```

Raisecom#config
Raisecom(config)#mls double-tagging tpid 8600
Raisecom(config)#interface port 1
Raisecom(config-port)#switchport mode dot1q-tunnel
Raisecom(config-port)#switchport vlan mapping 10 add-outer 100
Raisecom(config-port)#exit

```

Raisecom(config)#**interface port 5**

Raisecom(config-port)# **switchport mode trunk double-tagging**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show vlan mapping**

<i>Port</i>	<i>Inner VLAN</i>	<i>Outer VLAN</i>	<i>Hardware</i>

<i>1</i>	<i>10</i>	<i>100</i>	<i>Yes</i>

Raisecom#**show interface port 1 switchport**

Port 1:

Administrative Mode: dot1q-tunnel

Operational Mode: dot1q-tunnel

Access Mode VLAN: 4

Tunnel Mode VLAN: 4

Administrative Tunnel Mode OUTER VLANs of vlan mapping: 100

Operational Tunnel Mode OUTER VLANs of vlan mapping: 100

Administrative Trunk Allowed VLANs: 1-4094

Operational Trunk Allowed VLANs: n/a

Administrative Hybrid Allowed VLANs: 1-4094

Operational Hybrid Allowed VLANs: n/a

Administrative Hybrid Untagged VLANs: 1

Operational Hybrid Untagged VLANs: n/a

Native Mode VLAN: 1(default)

VLAN Ingress Filtering: Enabled

switchport forwarding allowed portlist: n/a

Raisecom# **show interface port 5 switchport**

Port 5:

Administrative Mode: trunk double-tagging

Operational Mode: trunk double-tagging

Access Mode VLAN: 1(default)

Tunnel Mode VLAN: 1(default)

Administrative Tunnel Mode OUTER VLANs of vlan mapping: n/a

Operational Tunnel Mode OUTER VLANs of vlan mapping: n/a

Administrative Trunk Allowed VLANs: 1-4094

Operational Trunk Allowed VLANs: 1,3-6,100

Administrative Hybrid Allowed VLANs: 1-4094

Operational Hybrid Allowed VLANs: n/a
Administrative Hybrid Untagged VLANs: 1
Operational Hybrid Untagged VLANs: n/a
Native Mode VLAN: 1(default)
VLAN Ingress Filtering: Enabled
switchport forwarding allowed portlist: n/a

SwitchB configuration is shown below:

Raisecom#config

Raisecom(config)#**mlls double-tagging tpid 8600**

Raisecom(config)#**interface port 1**

Raisecom(config-port)#**switchport mode dot1q-tunnel**

Raisecom(config-port)#**switchport vlan mapping 20 add-outer 200**

Raisecom(config-port)#**exit**

Raisecom(config)#**interface port 5**

Raisecom(config-port)# **switchport mode trunk double-tagging**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#show vlan mapping

<i>Port</i>	<i>Inner VLAN</i>	<i>Outer VLAN</i>	<i>Hardware</i>
1	20	200	Yes

Raisecom#show interface port 1 switchport

Port 1:

Administrative Mode: dot1q-tunnel

Operational Mode: dot1q-tunnel

Access Mode VLAN: 4

Tunnel Mode VLAN: 4

Administrative Tunnel Mode OUTER VLANs of vlan mapping: 200

Operational Tunnel Mode OUTER VLANs of vlan mapping: 200

Administrative Trunk Allowed VLANs: 1-4094

Operational Trunk Allowed VLANs: n/a

Administrative Hybrid Allowed VLANs: 1-4094

Operational Hybrid Allowed VLANs: n/a

Operational Tunnel Mode OUTER VLANs of vlan mapping: n/a
Administrative Trunk Allowed VLANs: 1-4094
Operational Trunk Allowed VLANs: 1,3-6,200
Administrative Hybrid Allowed VLANs: 1-4094
Operational Hybrid Allowed VLANs: n/a
Administrative Hybrid Untagged VLANs: 1
Operational Hybrid Untagged VLANs: n/a
Native Mode VLAN: 1(default)
VLAN Ingress Filtering: Enabled
switchport forwarding allowed portlist: n/a

15.3 VLAN Function Configuration

15.3.1 Configure VLAN

15.3.1.1 Switching mode introduction

Switching mode can be sorted to 3 types:

- **transparent** :transparent mode
- **vlan**: VLAN transmission mode
- **double-tagged-vlan**: Q-in-Q VLAN mode

In transparent mode, stable VLAN and port VLAN configuration do not take effect actually. When the system transforms from transparent mode to VLAN transmission mode, stable VLAN and port VLAN configuration can actually take effect.

In VLAN transmission mode, stable VLAN and port VLAN configuration take effect directly.

15.3.1.2 Default VLAN configuration

Function	Default value
Create VLAN	Default VLAN
Configure switching mode	Transparent mode
Configure the filtration mode of physical port ingress data packet	No ingress be abandoned.
Configure the data packets that are allowed to be received by physical port	All the data packets are allowed to be received
Configure the handling mode of physical port ingress data packet	No modification to outgress data packet

15.3.1.3 Configure switching mode

Step	Command	Command parameter introduction
1	config	Enter global configuration mode Configure switching mode
2	switch-mode {transparent/ dot1q-vlan/double-tagged-vlan}	transparent: transparent mode vlan: VLAN transmission mode double-tagged-vlan: Q-in-Q VLAN mode
3	exit	Return to privileged EXEC mode
4	show vlan	Show stable VLAN configuration

Notice:

- In transparent mode, stable VLAN and port VLAN configuration do not take effect actually. In this mode, the system record the configuration done by the commands below, but do not actually carry out them:
 - Vlan
 - Pvid
 - Vlan accept-frame
 - Vlan double-tag
 - Vlan egress default
 - Vlan ingress-filtering
- When the system transforms from transparent mode to VLAN transmission mode, the configuration commands above can really take effect. In VLAN transmission mode, the configurations above will be carried out and take effect directly.

15.3.1.4 Configure VLAN attribute

VLAN attribute configuration includes creating and deleting VLAN.

1. Create VLAN

Create VLAN, and define if out port is UNTAG port in VLAN member group, the steps are as follows:

Step	Command	Description
1	config	Enter global configuration

Create VLAN		
		Untagged: only out port is allowed to let go data packet without TAG;
2	vlan <2-4094>{ client [<i>clientid</i>] line [<i>lineid</i>]} untagged { client [<i>clientid</i>] line [<i>lineid</i>]}	Client: user end port; Line: line side port <2-4094>: VLAN ID; <i>Clientid</i> : user port number <i>lineid</i> line port number
3	exit	Return to privileged EXEC mode
4	show vlan	Show VLAN configuration

2. Delete VLAN

When user needs to delete a VLAN, follow the steps below:

Step	Command	Command parameter introduction
1	config	Enter global configuration mode
2	no vlan { <i>all</i> <2-4094>}	Delete VLAN <2-4094>: VLAN ID; All: all the stable VLAN except default VLAN (VLAN ID is 1)
3	exit	Return to global configuration mode
4	show vlan	Show VLAN configuration

15.3.1.5 Enable/disable VLAN filtration

The steps to configure the physical port ingress data packet filtration mode are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { client <i>clientid</i> line <i>lineid</i> }	Enter corresponding physical port configuration mode
3	vlan ingress-filtering { unknown-vlan not-member }	Configure the filtration mode of physical port ingress data packet
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface { client <i>client-list</i> line <i>line-list</i> } switchport	Show VLAN configuration

Use **no vlan ingress-filtering** to restore ingress data packet filtration mode to default value, that is, no ingress packet will be dropped.

15.3.1.6 Configure VLAN accept-frame tagging type

The steps to configure VLAN accept-frame tagging type are as follows:

Step	Command	Command parameter instruction
1	config	Enter global configuration mode
2	interface {client <i>clientid</i> line <i>lineid</i>}	Enter corresponding physical port configuration mode
3	vlan accept-frame {tag/untag}	Configure physical port accepted data packet Tag: accept only the data packets with TAG Untag: accept only the data packet without TAG
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface {client <i>client-list</i> line <i>line-list</i>} switchport	Show VLAN configuration

Use **no vlan accept-frame** to restore VLAN accept-frame tagging type to default value, that is, all the data packets are allowed to receive.

15.3.1.7 Configure outgress mode

The steps to configure the processing mode of physical port outgress data packet are as follows:

Step	Command	Command parameter instruction
1	config	Enter global configuration mode
2	interface {client <i>clientid</i> line <i>lineid</i>}	Enter corresponding physical interface configuration mode
3	vlan egress default {tag/untag unmodify}	Configure the processing mode to physical port outgress data packets Tag outgress data packet adding TAG Untag outgress data packet without TAG Unmodify do not modify outgress data packet
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface {client <i>client-list</i> line <i>line-list</i>} switchport	Show VLAN configuration

Notice:

- If double TAG function is enabled on physical port, the processing mode to physical port outgress data packet will not take effect.

15.3.1.8 Configure PVID

The steps to create and delete port VLAN ID are shown below:

Step	Command	Command parameter introduction
1	config	Enter global configuration

2	interface { client <i>clientid</i> line <i>lineid</i> }	Enter corresponding physical configuration mode
3	[no] pvid <1-4094> [<i>override</i>]	Create and delete port VLAN ID <1-4094>: port VLAN ID number <i>override</i> : use PVID value to recover the VLAN ID in the message
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface { client <i>client-list</i> line <i>line-list</i> } switchport	Show VLAN configuration

Use **no pvid** to delete PVID.

15.3.1.9 Monitoring and maintenance

Command	Description
show vlan [{1-4094}]	Show stable VLAN configuration
show interface client [<i>client-list</i>] switchport	Show user port VLAN configuration
show interface line [<i>line-list</i>] switchport	Show line port VLAN configuration

15.3.1.10 Typical configuration example

Topology structure is shown as figure 5:

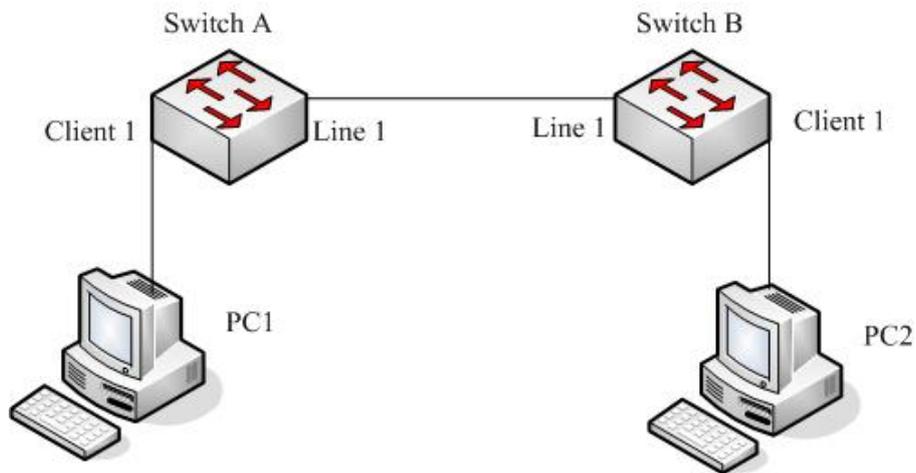

Fig 5 topology structure

As is shown in figure 5, Line1 of SwtichB connects with Line1 of SwtichA, configure SwitchA switching mode to vlan transmission mode, and configure Client1 outgress data packet filtration and VLAN accept-frame tagging type.

SwitchA configuration is shown below:

```
Raisecom#config
```

```
Raisecom(config)#vlan 3 line 1 client 1
```

```
Raisecom(config)#switch-mode dot1q-vlan
```

```
Raisecom(config)#interface client 1

```

```
4     L:1;C:1          n/a         --
```

5 L:1;C:1 n/a --

Raisecom#show interface client 1 switchport

Port client1:

PVID: 1

PVID override: Disabled

Double tag: Disabled

Vlan accept-frame: Untagged

Vlan ingress filtering: None

Egress default : Untagged

15.3.2 Basic Q-in-Q function

15.3.2.1 Basic Q-in-Q default configuration

Function	Default value
Configure outer layer Tag TPID value	The default TPID value of outer layer Tag is 0x9100
Enable/disable physical port double TAG function	Double TAG function is disabled

15.3.2.2 Configure basic Q-in-Q

Q-in-Q configuration includes: switching mode, Tpid, PVID and double tagging configuration, the configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	switch-mode { <i>transparent/ dot1q-vlan/double-tagged-vlan</i> }	Configure switching mode to double-tagged-vlan mode Transparent: transparent mode Vlan: VLAN Transmission mode double-tagged-vlan: Q-in-Q VLAN mode
3	mls double-tagging tpid <i>HHHH</i>	Configure outer layer Tag TPID value to HHHH <i>HHHH:</i> hex outer layer Tag TPID value, which is 1~4 figures hex number, range is 0x0-0xFFFF
4	interface { <i>client clientid line lineid</i> }	Enter corresponding physical interface configuration mode
5	pvid <1-4094> [<i>override</i>]	Create port VLAN ID <1-4094> : port VLAN id override: use PVID value to recover message VLAN ID
6	vlan double-tag	Enable physical port double TAG function
7	exit	Return to global configuration mode
8	exit	Return to privileged EXEC mode

9	show vlan	Show stable VLAN configuration
10	show interface {client <i>client-list</i> line <i>line-list</i>} switchport	Show VLAN configuration

Use **no mls double-tagging tpid HHHH** to restore outer layer Tag TPID to default value, 0x9100.

Use **no vlan double-tag** to stop physical port double TAG function.

15.3.2.3 Monitoring and maintenance

Command	Description
show vlan [{1-4094}]	Show stable VLAN configuration
show interface client [<i>client-list</i>] switchport	Show user port VLAN configuration
show interface line [<i>line-list</i>] switchport	Show line port VLAN configuration

15.3.2.4 Typical configuration example

Topology structure:

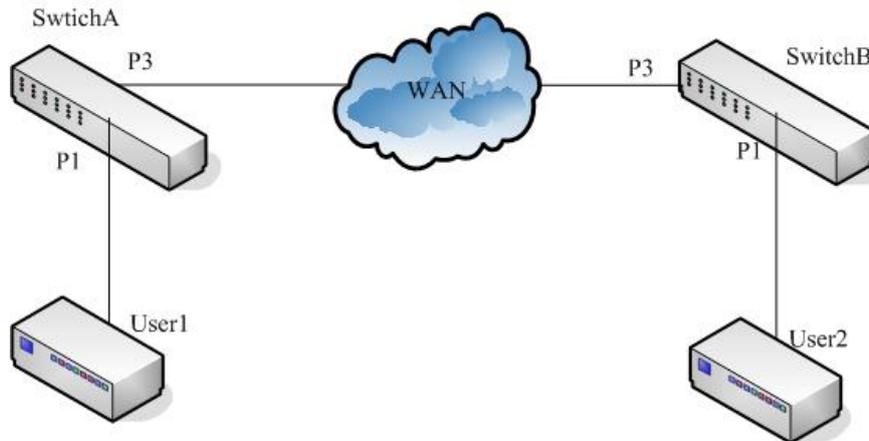

Fig 6 topology structure

As is shown in the topology structure, SwitchA and SwitchB are operator access switches, which belongs to VLAN100 and VLAN200 of the operator network. User1 and User2 are user access equipments, SwitchA use P5 to connect to MAN (metro area network), P1 connect to User1, SwitchB use P5 to connect to MAN, P1 connect to User2. Among them, MAN TPID is 0x9600. Configure SwitchA and SwitchB to realize basic Q-in-Q function.

SwitchA configuration is as follows:

```

Raisecom#config
Raisecom(config)#switch-mode double-tagged-vlan
Raisecom(config)#mls double-tagging tpid 9600
Raisecom(config)#interface client 3
Raisecom(config-port)#pvid 100
Raisecom(config-port)#vlan double-tag

```

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show vlan**

Switch mode: double-tagged-vlan

Core tag type: 0x9600

<i>VLAN</i>	<i>Ports</i>	<i>Untag Ports</i>	<i>Priority</i>

1	L:1;C:1-4	L:1;C:1-4	--
3	C:3	n/a	--
5	L:1	n/a	--

Raisecom#**show interface client 3 switchport**

Port client3:

PVID: 100

PVID override: Disabled

Double tag: Enabled

Vlan accept-frame: All

Vlan ingress filtering: None

Egress default : Unmodify

SwitchB configuration is as follows:

Raisecom#**config**

Raisecom(config)#**switch-mode double-tagged-vlan**

Raisecom(config)#**mls double-tagging tpid 9600**

Raisecom(config)#**interface client 3**

Raisecom(config-port)#**pvid 200**

Raisecom(config-port)#**vlan double-tag**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show vlan**

Switch mode: double-tagged-vlan

Core tag type: 0x9600

<i>VLAN</i>	<i>Ports</i>	<i>Untag Ports</i>	<i>Priority</i>

1	L:1;C:1-4	L:1;C:1-4	--
5	L:1	n/a	--
6	C:2	n/a	--

Raisecom#**show interface client 3 switchport**

Port client3:

PVID: 200

PVID override: Disabled

Double tag: Enabled

Vlan accept-frame: All

Vlan ingress filtering: None

Egress default : Unmodify

15.4 VLAN configuration

15.4.1 VLAN based on port

The device switch mode can be configured into two types, transparent mode and dot1q-vlan mode.

In transparent mode, static VLAN and VLAN configuration under port does not actually work. Only when the system transforms from transparent mode to dot1q-vlan mode can static VLAN and port VLAN configuration under port takes effect.

In dot1q-vlan mode, static VLAN and VLAN configuration under port takes effect directly.

15.4.1.1 VLAN port mode introduction

Member port mode	VLAN member attribution
ACCESS	In Access mode, by default only VLAN1 data packets are allowed to pass the port, and the data packets sent from the port do not take VLAN 1 tag. Access port mode can be designated to multi-VLAN, but the data packets sent from access port do not take VLAN tag. Access port is mainly used to connect terminal user.
TRUNK	In trunk mode, all the VLAN packets are allowed to pass by default, and all the data packets except VLAN 1 transmitted from the have tag. Trunk mode can be designated to multi-VLAN, and user can configure if the data packet with a certain VLAN tag should be transmitted from the port. When the switch is used as the uplink tag port, it can be configured to trunk mode

15.4.1.2 Default VLAN configuration

Function	Default value
Device switch mode	transparent
Create static VLAN	Default VLAN and cluster VLAN exist in the system, that is VLAN1 and VLAN2, all the ports exist in VLAN1.
VLAN name	System default VLAN name is 'default', other static VLAN name is 'VLAN' added its 4 figures VLAN ID
Static VLAN activity state	Newly created static VLAN activity state is suspend.
VLAN priority	No priority

Port mode	Access
ACCESS VLAN	VLAN 1
ACCESS VLAN override	Disable
The VLAN that is allowed to pass the port in access mode	VLAN 1
The Native VLAN of trunk port	VLAN 1
The VLAN that is allowed to pass VLAN in port VLAN mode	All VLAN
The UNTAG VLAN that is allowed to pass VLAN in port trunk mode	VLAN 1

15.4.1.3 Configure switch mode

Step	Command	Description
1	config	Enter global configuration mode
2	switch-mode <i>{transparent dot1q-vlan}</i>	Configure switch mode
3	exit	Return to privileged EXEC mode
4	show vlan	Show static VLAN configuration

Attention:

- In transparent mode, the device transmits data packets without the limitation of VLAN, the system records but do not actually execute the following configuration:
 - Static VLAN will be created and enabled
 - VLAN priority
 - Port access VLAN and override
 - Port access egress-allowed VLAN
 - Port trunk native VLAN
 - Port trunk allow VLAN, port trunk untag VLAN
 - Port mode
 - QinQ configuration

15.4.1.4 Configure VLAN attribution

VLAN attribution includes to create, delete VLAN, configure VLAN name, priority, and active state. The steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	create vlan {2-4094} (active suspend) [priority <0-7>]	Create VLAN, confirm the state (active/suspend),configure the priority Active: active state

		Suspend: hang-up state
		0-7: VLAN priority
		{2-4094}: VLAN ID
		Name VLAN
3	name <i>WORD</i>	<i>WORD</i> VLAN name, no longer than 15 characters
4	state { <i>active</i> / <i>suspend</i> }	Configure VLAN activity state
5	exit	Return to global configuration mode
6	exit	Return to privileged EXEC mode
7	show vlan	Show VLAN configuration

Use **no vlan** <2-4094> to delete VLAN in global configuration mode.

Attention:

- The newly created VLAN using VLAN <1-4094> is in suspend state, if user hopes to make it active in the system, the command **state** that will be introduced later can help.
- By default there are two VLAN in the system, that is default VLAN (VLAN1) and cluster VLAN (VLAN2), all the ports belongs to the default VLAN. Default VLAN is not allowed to be deleted. To learn more about cluster VLAN, ref. 19-cluster management function.
- By default, the default VLAN (VLAN1) name is 'Default', other static VLAN name is 'VLAN' added with 4 figure VLAN ID, for example the default name of VLAN 3 is 'VLAN0003', the default name of VLAN 4094 is 'VLAN4094'.
- Only when a VLAN be activated in the system can it be active. When VLAN active status is suspend, user can configure the VLAN, like to delete/add port, configure VLAN priority, the system will keep the configuration, once the VLAN is activated, the configuration will take effect in the system.

15.4.1.5 Configure VLAN priority

By default, there is no priority when creating VLAN, N/A will be shown, VLAN priority range is 0-7. The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	vlan <1-4094>	Create VLAN and enter its configuration mode <1-4094> VLAN ID
3	priority <0-7>	Configure VLAN priority 0-7: VLAN priority
4	exit	Return to privileged EXEC mode
5	show vlan	Show VLAN configuration

Use **no vlan**{2-4094} **priority** in global configuration mode, or **no priority** in VLAN mode to delete VLAN priority.

Attention:

- Default VLAN (VLAN1) has no configuration priority.

- The new created VLAN has no priority by default, and shows N/A. VLAN priority range is 0-7.
- VLAN priority takes effect only when the VLAN is activated. When VLAN is not created or when the state is suspend, user can configure the VLAN priority for still, and the system will keep the configuration and enable the configuration when the VLAN is activated.
- When VLAN priority is configured, the device uses VLAN priority to form a queue or cover message COS value when transmitting VLAN messages. Use **mls qos vlan (priority-set | cos-voerride)** and **mls qos vlan priority-set cos-override** for specific configuration. If VLAN priority is deleted or if VLAN is not activated, the commands above will not take effect either. Ref. 27-QoS configuration guide for QoS commands.

15.4.1.6 Configure port VLAN mode

Port VLAN mode configuration includes port mode, ACCESS VLAN, ACCESS mode allowed VLAN list, TRUNK local VLAN, TRUNK allowed VLAN list, TRUNK UNTAG VLAN list and so on.

You must to configure port VLAN mode in physical interface configuration mode, the steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter corresponding physical interface configuration mode
3	switchport mode { access trunk }	Configure port VLAN mode
4	switchport access vlan <i><1-4094></i> [override]	Configure port ACCESS VLAN 1-4094: VLAN ID Override: VLAN override
5	Switchport access egress-allowed vlan { all <i>vlan-list</i> add <i>add-vlan-list</i> remove <i>remove-vlan-list</i> }	Configure the VLAN that Access port allows to pass All , all the VLAN are allowed to pass; <i>Vlan-list</i> , VLAN that is allowed to pass, the existed configuration will be covered directly Add <i>add-vlan-list</i> , add allowed VLAN on the base of existed allowed VLAN Remove <i>remove-vlan-list</i> , delete allowed VLAN on the base of existed allowed VLAN
6	switchport native vlan <i><1-4094></i>	Configure Native VLAN for Trunk port Configure the VLAN that is allowed to pass Trunk port All allow all the VLAN to pass
7	switchport trunk allowed vlan { all <i>vlan-list</i> add <i>add-vlan-list</i> remove <i>remove-vlan-list</i> }	<i>Vlan-list</i> , allow the passed VLAN ,cover the existed configuration directly; Add <i>add-vlan-list</i> , add allowed VLAN on the base of the existed allowed VLAN Remote <i>remote-vlan-list</i> , delete allowed VLAN on the base of the existed allowed VLAN
8	switchport trunk untagged vlan { all <i>vlan-list</i> add <i>add-vlan-list</i> }	Configure the Untagged VLAN that is allowed to pass Trunk port,

	remove <i>remove-vlan-list</i> }	All, all the VLAN are allowed to pass; <i>Vlan-list</i> , the VLAN that are allowed to pass, the existed configuration will be covered directly
9	exit	Return to global configuration mode
10	exit	Return to privileged EXEC mode
11	show interface port [<i>port-list</i>] switchport	Show port VLAN attribution configuration

Use **no switchport mode** to restore port VLAN to default value. Use **no switchport access vlan** to restore Access VLAN to default value, which is to configure port Access VLAN to VLAN1. Use **no switchport trunk native vlan** to restore the Native VLAN of Trunk port to default value, or VLAN1. Use **no switchport trunk allowed vlan** to restore the VLAN that is allowed to pass through Trunk port to default value, all the VLAN can pass. Use **no switchport trunk untagged vlan** to restore the Untagged VLAN that is allowed to pass Trunk port, only VLAN1 shall pass.

When the user is configured the VLAN or UNTAG VLAN that is allowed to pass, user will be noticed 'please input 'y' to confirm the allowed VLAN', input 'y/Y' or press ENTER directly for confirmation, then the configured value will take effect, or the configuration will not take effect when user input other value.

Notice:

- By default, all the ports allow default VLAN (VLAN1) to pass, and all the data packets of the default VLAN transmitted from the ports do not take the corresponding VLAN TAG.
- In port Access mode, no matter how the VLAN list that is allowed to pass Access port is configured, the port allows the data packets of Access VLAN to pass, and the packets sent out do not take corresponding VLAN TAG.
- In port Access mode, when configuring Access VLAN, if the VLAN is not created and activated, the system will create and enable the VLAN automatically.
- In port Access mode, if Access VLAN is deleted or hanged up by user, the system will configure the port Access VLAN to default VLAN (VLAN1).
- In port Trunk mode, no matter the configuration of the VLAN list that is able to pass Trunk port and Untagged VLAN list, the port allows the data packets of NATIVE VLAN to pass, and the transmitted data packets do not take corresponding VLAN TAG.
- In port Trunk mode, when configured Native VLAN, if the VLAN is not created or enabled, the system will create and enable the VLAN automatically.
- In port Trunk mode, if Native VLAN is deleted or blocked by user, the system will set the port Trunk Native VLAN to default VLAN (VLAN1) automatically.
- In port Trunk mode, if the configured Native VLAN is not default VLAN, while the VLAN list that allows passing Trunk port includes not default VLAN, then the port will not allow default VLAN data packets pass.
- Configuring Trunk allowed VLAN list and Trunk Untagged VLAN list is related. When configuring Trunk allowed VLAN list, the system will delete the not allowed VLAN in Trunk Untagged VLAN list; when configuring Trunk Untagged VLAN list, the system will add all Untagged VLAN to Trunk allowed VLAN.
- Access VLAN and Trunk Native VLAN can not be configured to cluster VLAN.
- The VLAN list that is allowed to pass Access port, Trunk allowed VLAN list and Trunk Untagged VLAN list takes effect only to static VLAN, not to cluster VLAN, GVRP static VLAN.

15.4.1.7 Configure port protection

The steps are as follows:

Step	Command	Description
------	---------	-------------

1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter corresponding physical interface configuration mode
3	switchport protect	Configure physical port to protected port Protect protected port
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show interface port protected	Show physical port protection attribution

Use **no switchport protection** to cancel port protection configuration.

15.4.1.8 Configure port forwarding

By default, the port is able to transmit messages to all other ports except to the port itself. The function supports configuring port list under port to limit the port range that could transmit messages.

To configure forwarding port, you need to enter the designated port or range port mode, the commands are shown below:

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <i>portid</i>	Enter port mode
3	switchport forwarding allowed portlist <i>port-list</i>	Configure port forwarding list
4	exit	Quit from port mode
5	exit	Quit from global mode
6	show interface port [<i>port-list</i>] switchport	Show port forwarding list

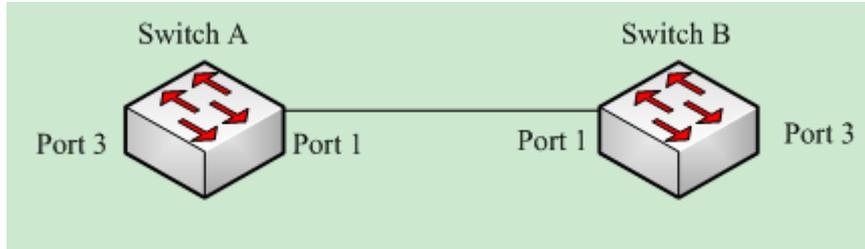

Use **no switchport forwarding allowed** *portlist* to restore the forwarding list under port to default value, that is all the other ports except the port itself.

15.4.1.9 Monitoring and maintenance

Command	Description
show interface port [<i>port-list</i>] switchport	Show port VLAN attribution configuration
show interface clinet <i>clinetid</i> switchport	Show the client port VLAN attribution
show interface line <i>lineid</i> switchport	Show line port VLAN attribution
show interface port protected	Show the protected port attribution of the physical port

15. 4. 1. 10 Typical configuration

The topology:

As is shown in the figure above, SwitchA and SwtichB use Port1(SwitchA) and Port1(SwitchB) to connect each, configure Port1 of the two devices to Trunk port, allowing VLAN1-VLAN100, configure Port3(SwitchA) and Port3(SwitchB) to Access port, Access VLAN to VLAN6. The configuration of SwitchA and SwtichB is totally the same. The configuration step of SwtichA is shown below:

Configuration of SwitchA:

```
Raisecom#config
```

```
Raisecom(config)#vlan 6
```

```
Raisecom(config-vlan)#state active
```

```
Raisecom(config-vlan)#exit
```

```

Chapter 16 RMON

16.1 RMON principle interview

RMON is a standard of network data monitoring using different network Agent and manage station systems designated by IETF, which can make SNMP monitoring remote equipments more effectively and forwardly. Therefore, network administrator can track network, network segment and the equipment faults more quickly. This way reduces the data stream between the manage station and the Agent and makes simple and powerful management to large network, which makes up the limitation that SNMPS is facing in the distributed connection that is becoming larger and larger.

We can use SNMP Agent in the switch side to monitor and manage the switch network situation. Now the 1, 2, 3, 9 group of RMON is realized, that is statistic group, history group, alarm group and event group.

- Statistics: Collects Ethernet, Fast Ethernet, and Gigabit Ethernet statistics on an interface.
- History: Collects a history group of statistics on Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces for a specified polling interval.
- Alarm: Monitors a specific management information base (MIB) object for a specified interval, triggers an alarm at a specified value (rising threshold), and resets the alarm at another value (falling threshold). Alarms can be used with events; the alarm triggers an event, which can generate a log entry or an SNMP trap.
- Event: Determines the action to take when an event is triggered by an alarm. The action can be to generate a log entry or an SNMP trap.

16.2 RMON configuration

16.2.1 Default RMON configuration

Function	Default value
Static group	Enabled
History static group	No
Alarm group	No
Event group	No

16.2.2 RMON static group configuration

Configure the port's statistic function parameter, if the port's statistic function is disabled, use the command to enable it again; if it is enabled, use the command to change the corresponding parameter. By default all the port's statistic function is enabled, use command **no** to disable it.

Step	Command	Description
1	config	Enter global configuration mode
2	rmon statistics {ip l3_interface port ip l3_interface	set the statistics function of

	<i>port_list</i> } [owner STRING]	layer 3 interface, range is 0-14; port <i>port_list</i> set the statistics function for the physical port, range is 1-26; owner STRING set the owner name of current statistics group, default value is "monitorEtherStats".
3	exit	Exit from global configuration mode to enter privileged EXEC mode.
4	show rmon statistics	Show statistics group information.

To disable statistic group, use the command: **no rmon statistics** {ip *l3_interface* | **port** *port_list*}

Notice:

- Before RMON function is configured, SNMP Agent correct configuration must be made sure.
- When the statistic function of some port is disabled, it means not that data statistic is stopped, but that user can no longer acquire the port's statistic data.

16.2.3 RMON history statistic and configuration

Configure the port's statistic function parameter. If the port's history statistic function is disabled, use the command to enable it again; if it is enabled, use the command to change the corresponding parameters. All the ports, including three-layer port and physical port, are open by default, Use command **no** to disable it. When one port's history group function is disabled, data collection and statistic function can not go on, and all the history data collected before will be cleared.

Step	Command	Description
1	config	Enter global configuration mode
2	rmon history {ip <i>l3_interface</i> port <i>port_list</i> } [shortinterval <i>short-time</i>] [longinterval <i>long-time</i>] [buckets <i>queuesize</i>] [owner STRING]	ip <i>l3_interface</i> Set the RMON history function of layer 3 interface, range is 0-14; port <i>port_list</i> set the RMON history function of physical port, range is 1-26; shortinterval <i>short-time</i> : the short time interval of history data collection of the port, range is 1-3600, default value is 2 seconds. longinterval <i>long-time</i> the long time interval of history data collection of the port, range is 1-3600, default value is 300 seconds (5 minutes); buckets <i>queuesize</i> : circular queue size for history data, range is 10-1000, default is 10. owner STRING: set the owner name of RMON history group, default name is "monitorHistory".
3	exit	Exit from global configuration mode and enter privileged EXEC mode.
4	show rmon history	Show history statistics information

16.2.4 RMON alarm group configuration

Use command **no** to delete a warning to configure a MIB variable that is being monitored,

The MIB variable that is being monitored must be really exist, and it must be INTEGER type in ASN.1 expression, like type of INTEGER, Counter, Gauge and TimeTicker. If the variable does not exist or the type is incorrect when configured, return fault; in the alarm that has been successfully configured, if the variable is not collected in the late time, the warning will be shut up. Re-configuration is needed to monitor the variable again.

If the index number of trigger event is not configured, the default value will be 0, which means the event will not be triggered, because 0 is not a valid event number. If the index number of the event is not 0, but the event is not configured correspondingly in the event group, then the event will not be triggered successfully when the monitoring variable exceeds until the event is established.

Step	Command	Description
1	config	Enter global configuration mode
2	rmon event <i>number</i> [log] [trap] [description <i>string</i>] [owner <i>string</i>]	log whether log the information and send system log information trap whether send trap description <i>string</i> : description string owner <i>string</i> the owner of the event
3	exit	Exit from global configuration mode.
4	show event <i>number</i>	Show configuration information

Use command **no alarm** *number* to delete alarm.

16.2.5 RMON event group configuration

Step	Command	Description
1	config	Enter global configuration mode
2	rmon event <i>number</i> [log] [trap] [description <i>string</i>] [owner <i>string</i>]	Configure the event group function parameter of the port. <i>number</i> event index number description <i>string</i> description character string owner <i>string</i> owner of the event
3	exit	Quit global configuration mode and enter privileged EXEC mode
4	show alarm <i>number</i>	Show the configuration result <i>number</i> event index number

Use the command **no event** *number* to delete event.

16.2.6 Monitoring and maintenance

Command	Description
show rmon	Show all the RMON four group information
show rmon alarms	Show alarm information, including alarm number, name, threshold, sampling period and sampling value.
show rmon events	Show alarm information, including alarm number, name, threshold, sampling period and sampling value.
show rmon statistics	Show port information which has enabled statistics group.

Configure all the RMON groups' function to default state, that is the state when the switch has just been started

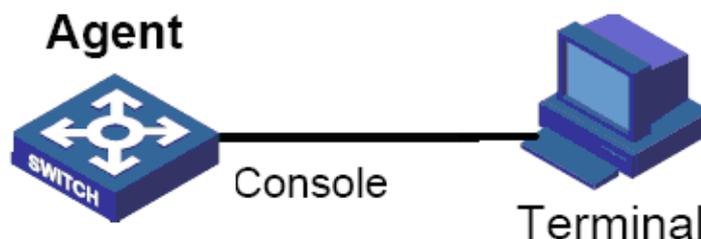

Step	Command	Description
1	config	Enter global configuration mode
2	clear rmon	Restore to the default state
3	exit	Quit global configuration mode and enter privileged EXEC mode.

16.2.7 Typical configuration example

1. Network requirement:

Agent connects the configuration terminal through console port, and connects remote NMS through Internet. In RMON Ethernet static table, set a table item, make performance statistic for Ethernet port, and record log when in a certain time the byte number that the port received exceeds the configured threshold.

2. Network figure

3. Configuration steps:

First, establish a event with the index number 1, and the description character stream is High-ifOutErrors for the event that sends out **log**, owner is system. Then, set a alarm, monitor MIB variable 1.3.6.1.2.1.2.2.1.20.1, examine if the variable is rising/falling every 20s, if it has rise 15, alarm will be triggered, the owner's name is the same with the event group.

Raisecom#**config**

Raisecom(config)#**rmon event 1 log description High-ifOutErrors owner system**

Raisecom(config)#**rmon alarm 10 1.3.6.1.2.1.2.2.1.20.1 interval 20 delta rising-threshold 15 1 falling-threshold 0 owner system**

Raisecom(config)#**exit**

Raisecom#**show rmon alarm**

Alarm 10 is active, owned by system

Monitors 1.3.6.1.2.1.2.2.1.20.1 every 20 seconds

Taking delta samples, last value was 0

Rising threshold is 15, assigned to event 1

Falling threshold is 0, assigned to event 0

On startup enable rising and falling alarm

Raisecom#show rmon event

Event 1 is active, owned by system

Event generated at 0:0:0

Send TRAP when event is fired.

Chapter 17 ARP

This chapter is mainly about how to configure and maintain ARP on the switch, including:

- ◇ ARP interview
- ◇ ARP configuration
- ◇ Monitoring and maintenance
- ◇ Typical configuration example

17.1 ARP principle interview

When the switch software system is transmitting IP message, it is needed to look for its physical address according to the requirement so that the message can be sent to destination host. The mapping relationship of IP address and MAC address is kept in ARP address mapping table.

ARP address mapping table includes 2 types of MAC addresses:

- Dynamic learned MAC address: Dynamic MAC addresses learned through ARP protocol and will be aged if not used.
- Static MAC address: added manually to the table and do not age.

If host A sends IP packets to host B, host A uses the IP address of host B and searches corresponding MAC address in its own ARP table. If there is the MAC address of host B, host A will send the IP packet directly; if there is not the MAC address of host B, host A will send ARP request, get the MAC address of host B and add the address to the ARP table.

In most of the cases, when host A sends IP packets to host B, it is pretty possible that host B will send packets to host A again, so host B will also need to send ARP request to host A. In order to reduce the traffic in the network, host A write its own MAC address in the ARP request. When host B receives the ARP request, it will record the MAC address of host A to its mapping table. Then it is more convenient for host B to communicate host A.

In some special situation, administrator also can configure ARP address mapping table manually.

17.2 ARP configuration

This part is about how to configure and maintain ARP on the switch, including:

- Default ARP configuration
- Adding stable ARP address table item
- Deleting ARP address mapping table item
- Configuring ARP dynamic address mapping table item overtime
- Configuring ARP dynamic learning mode
- Clearing ARP address mapping table

17.2.1 Default ARP configuration

Function	Default value
Stable ARP address table item	No
APR dynamic address mapping table item overtime	1200s
ARP dynamic learning mode	learn-reply-only

17.2.2 Adding dynamic ARP address table item

Usually, ARP mapping table is maintained by dynamic ARP protocol, ARP will search the resolution from IP address to MAC address according to the protocol, needing not the participation of administrator. Only when it is needed to add stable ARP table item will the ARP manual configuration commands be used to ARP mapping table.

Stable ARP address table item has the features below:

- Stable ARP address table item has to be added and deleted manually
- Stable ARP address will not grow old

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	arp ip-address mac-address	Add a stable table item to ARP address mapping table
3	exit	Quit global configuration mode and enter privileged EXEC mode
4	show arp	Show all the table units in ARP address mapping table

Notice: The IP address that is stable added to ARP table item must belongs to the IP network segment that the switch's three-layer port belongs to.

Use global configuration command **no arp ip-address** to delete stable ARP table item.

17.2.3 Configure the overtime of ARP dynamic address table item

User can configure the existing time of ARP dynamic item, ARP dynamic table that exceeds the time will be deleted.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	arp aging-time sec	Configure the existing time of ARP dynamic table item, ARP dynamic table item that exceeds the time will be deleted
3	exit	Quit global configuration mode and enter privileged EXEC mode
4	show arp	Show all the table items of ARP address mapping table

Notice: If the exceeding time is set to 0, ARP dynamic table item will no longer grow old.

Use global configuration command **no arp aging-time** to restore the default configuration of ARP dynamic address mapping table item exceeding time.

17.2.4 Configure ARP dynamic learning mode

It is mentioned above that, to reduce the network communication capacity, when host A is sending its ARP request group, it will write the mapping from its own IP address to the physical address into ARP request group. When host B receives the ARP request group from host A, host B will write the address mapping of host A into its own mapping table. This makes the process of host B sending data to host A more convenient. Configure ARP dynamic learning mode to realize the process mentioned above for learn-all.

The intention of configuring ARP dynamic learning mode is to prevent ARP attack from happening. When configured **learn-all** mode, the host will learn both ARP request message and response message; when configured **learn-reply-only** mode, it will learn ARP response message only, and responds ARP response messages only for request message, without learning ARP.

Step	Command	Description
1	config	Enter global configuration mode
2	arp mode { <i>learn-all</i> / <i>learn-reply-only</i> }	Configure ARP dynamic learning mode
3	exit	Quit global configuration mode and enter privileged EXEC mode
4	show arp	Show all the table items in ARP address mapping table

17.2.5 Clearing ARP address mapping table

In some situations, network administrator may need to clear all the ARP table items. Use command **clear arp** to realize it.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	clear arp	Clear all the table items in ARP address mapping table
3	exit	Quit global configuration mode and enter privileged EXEC mode
4	show arp	Show all the table items in ARP address mapping table

17.3 Monitoring and maintenance

Use command **show arp** to show the commands of all the table items in the ARP address mapping table, including: the IP address of each table item, MAC address and table item type.

Command	Description
show arp	Show all the table items in ARP address mapping table

17.4 Typical configuration example

1) Network request:

- Configure the aging time of the switch dynamic ARP table item to 600s.
- To prevent ARP attack in some situations, configure the switch's dynamic ARP learning mode to **learn-reply-only**.
- Under the premise that IP port address is configured, add a stable ARP table item.

2) Configuration steps:

```
Raisecom(config)# arp aging-time 600
```

```
Raisecom(config)# arp mode learn-reply-only
```

```
Raisecom(config)# arp 10.0.0.1 0050.8d4b.fd1e
```

Chapter 18 SNMP

18.1 SNMP principle

18.1.1 SNMP overview

Now, the network management protocol that is the most extensively used in computer network is SNMP (Simple Network Management Protocol), which is also one of the standard protocol for Internet management.

On structure, SNMP is made up of agent and Network Management Station (NMS), or agent/management station mode. Among them, NMS is the workstation that runs the client program, the management workstations that is usually used now are IBM NetView and Sun NetManager; Agent means the server software that is running on the network equipment like the switch, management information base (MIB) is maintained in Agent.

When SNMP Agent receives the request message Get-Request, Get-Next-Request, Get-Bulk-Request that about MIB variable from NMS, Agent will take read/write operation to the MIB variable that NMS requested according to the message type, then create Response message according to the result, and send it to NMS as response.

On the other side, when SNMP Agent receives the message about some equipment's state like cold/warm booting or anomalous event, it will create a Trap message and send it to NMS actively and report these important incidents.

Raisecom serious SNMP Agent supports SNMPv1, SNMPv2c and SNMPv3

18.1.2 SNMP V1/V2 interview

SNMPv1 is a simple request/response protocol. The network management system sends out a request, the manager returns a response. The action is realized by one of the four protocol operations. The four operations are GET, GETNEXT, SET and TRAP. Through GET operation, NMS get one or more object (instance) values. If the agent can not offer all the request (instance) values from the request list, it will not offer any value. NMS use GETNEXT operation to get the next object instance value from the request list or the object list. NMS use SET operation to send commands to SNMP proxy and request re-configuration to the object value. SNMP proxy use TRAP operation to inform NMS the specific event irregularly.

Different from SNMPv1's simplex centralized management, SNMPv2 supports distributed/layered network management structure, in SNMPv2 management model some systems have both manager and proxy function; as proxy, it can receive the commands from senior management system, interview the local information stored, and offer the information summary of other proxy in the management domain that it charges, then send Trap information to senior manager.

18.1.3 SNMPv3 interview

SNMPv3 uses user-based security model. Whatever it is NMS sending query message to SNMP Agent, or SNMP Agent sending Trap message to NMS, the communication between NMS and SNMP Agent must be

in the name of a certain user. Both SNMP NMS and proxy side maintains a local SNMP user table, user table record username, user related engine ID, if identification is needed and the identification key, encryption information, so that it could make correct resolution to the message content and suitable response. SNMP user's configuration is to create key through the password information in the command lines, and add a user in local SNMP user table of the switch.

18.2SNMPv1/v2/v3 management configuration

18.2.1 Default SNMP configuration

Function	Default value																
trap switch	Enabled																
The mapping relationship between SNMP user and visiting group	<p>The existed ones by default: initialnone, initial group</p> <table border="1"> <thead> <tr> <th>Index</th> <th>GroupName</th> <th>UserName</th> <th>SecModel</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>initialnone</td> <td>raisecomnone</td> <td>usm</td> </tr> <tr> <td>1</td> <td>initial</td> <td>raisecommd5nopriv</td> <td>usm</td> </tr> <tr> <td>2</td> <td>initial</td> <td>raisecomshanopriv</td> <td>usm</td> </tr> </tbody> </table>	Index	GroupName	UserName	SecModel	0	initialnone	raisecomnone	usm	1	initial	raisecommd5nopriv	usm	2	initial	raisecomshanopriv	usm
Index	GroupName	UserName	SecModel

18.2.2 SNMPv1/v2 configuration

To protect itself and keep MIB from invalid visit, SNMP Agent brings in the idea of group. The management station in a group must use the group's name in all the Get/Set operations, or the request will not be taken.

The group name uses different character stream to sign different SNMP groups. Different groups may have read-only or read-write visit right. The group that has read-only right can only query the equipment information, while the group with read-write right can not only query the equipment information but also configure it.

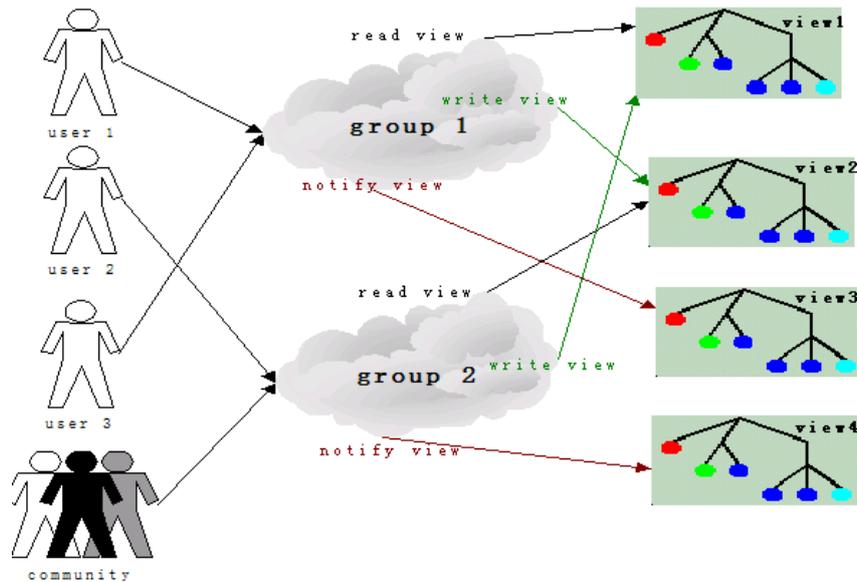

When SNMPv1 and SNMPv2 takes group name authentication project, the SNMP message whose group name is not accorded will be dropped. The whole configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
(optical)	snmp-server view <i>view-name oid-tree</i> [<i>mask</i>] { included excluded }	Define the figure and the contained MIB tree range; <i>view-name</i> : figure name, the length can not exceed 32 character; <i>oid-tree</i> : OID tree, OID number which the depth can not exceed 128; <i>mask</i> : OID tree mask, the depth can not exceed 128, format is OID, each option of OID can be only 0 or 1;
2	snmp-server community <i>community-name</i> [view <i>view-name</i>] { <i>ro</i> <i>rw</i> }	Configure the community name and the relevant attributes. <i>view-name</i> : the view name ro: read-only rw: read-and-write
3	exit	Return to privileged EXEC mode
4	show snmp community	Show group information

Notice: Both SNOMPv1 and SNMPv2 takes group name authentication project, the SNMP message that is not accord with the group name that has been identified will be dropped.

18.2.3 SNMPv3 configuration

SNMPv3 takes USM (user-based security model) which is based on user's security safety model. USM brings the principle of interview group: one user or several users accord with a interview group, each interview group set the corresponding write, read, notify view, the user in interview group has the right in the figure. The interview group in which user send requests likeGet and Set must have the corresponding right, or the request will not be taken.

From the figure above, we can see that the normal interview to the switch for NMS, needs not only configuring the user but also making sure which group the user belongs to, the figure right that the interview group has and each figure. Complete configuration (including user's configuration) process is as follow:

Step	Command	Description
1	config	Enter global configuration mode
2	snmp-server user <i>username</i> [remote engineid] [authentication { md5 sha } <i>authpassword</i>]	Add a user
3	snmp-server view <i>view-name oid-tree</i> [<i>mask</i>] { included excluded }	Define the view and its privilege of the MIB <i>view-name</i> specify the configured name of view <i>,oid-tree</i> specify OID tree <i>mask</i> the mask of OID sub-tree, each bit corresponds to a note of the sub-tree included means that the scale of the view includes all the MIB variables under OID tree excluded means that the scale of the view includes all the MIB variables out of OID tree
4	snmp-server group <i>groupname user username</i> { v1sm v2csm usm }	Configure the group which the user belongs to
5	snmp-server access <i>groupname</i> [read readview] [write writeview] [notify notifyview] [context contextname [{ exact prefix }]] { v1sm v2csm usm } { noauthnopriv authnopriv }	Define the access privilege of the group <i>Groupname</i> is the name of access group; <i>readview</i> is the read view, default is internet; <i>writeview</i> is the write view, default is empty; <i>notifyview</i> is informational view, default is empty; <i>contextname</i> is the name of context or its prefix; exact prefix stands for the match type of the context name: exact means the input should be fully matched with the name of context, prefix means that only the first several letters should

		match with the name of context;
		v1sm v2csm usm are the security model, stands for SNMPv1 security model,SNMPv2 is the security model based on community and SNMPv3 is the security model based on the user respectively;
		noauthnopriv authnopriv is the security level, stands for no authentication and no encryption, or authentication without encryption respectively.
6	exit	Exit to privileged configuration mode
7	show snmp group show snmp access show snmp view show snmp user	Show SNMP configuration information

18.2.4 SNMP v1/v2 TRAP configuration

Step	Command	Description
1	config	Enter global configuration mode
2	interface ip 0	Enter IP port mode
3	ip address A.B.C.D[A.B.C.D] vlanID	Configure the switch IP address A. B. C. D IP address [A. B. C. D] subnet mask vlanID vlan number
4	exit	Quit global configuration mode and enter privileged EXEC mode
5	snmp-server host A.B.C.D version {1 2c} NAME [udpport <1-65535>] [bridge] [config] [interface] [rmon] [snmp] [ospf]	Configure SNMPv1/v2 Trap object host A.B.C.D NMS IP address NAME SNMPv1/v2c group name <1-65535> receiving port number that object host receives Trap, by default it is 162;
6	exit	Return to privileged EXEC mode
7	show snmp host	Show configuration state

18.2.5 SNMPv3 Trap configuration

Step	Command	Description
1	config	Enter global configuration mode
2	interface ip 0	Enter IP port mode

3	ip address <i>A.B.C.D</i> [<i>A.B.C.D</i>] <i>vlanID</i>	Configure the switch IP address <i>A.B.C.D</i> : IP address <i>[A.B.C.D]</i> : subnet mask <i>vlanID</i> : vlan number
4	exit	Quit global configuration mode and enter privileged EXEC mode
5	snmp-server host <i>A.B.C.D</i> version 3 { noauthnopriv authnopriv } <i>NAME</i> [udpport < <i>1-65535</i> >] [bridge] [config] [interface] [rmon] [snmp] [ospf]	Configure SNMPv3 Trap object host <i>A.B.C.D</i> : HOST IP address <i>NAME</i> : SNMPv3 username < <i>1-65535</i> >: receiving port number that object host receives Trap, by default it is 162;
6	exit	Return to privileged EXEC mode
7	show snmp host	Show configuration state

18.2.6 Other SNMP configuration

1. Configure the network administrator label and contact access

The network administrator label and contact access `sysContact` is a variable of system group, its effect is to configure the network administrator label and contact access for management switch.

Step	Command	Description
1	config	Enter global configuration
2	snmp-server contact <i>sysContact</i>	Configure network administrator label and contact access
3	exit	Return to privileged EXEC mode
4	show snmp config	Show configuration situation

2. Enable/disable system sending trap message

Trap is used mainly for providing some switch important events to NMS. For example, when receiving a request with a fault group name and being allowed to send SNMP Trap, the switch will send a Trap message of failed authentication.

Step	Command	Description
1	config	Enter global configuration mode
2	snmp-server enable traps	Allow the switch to send trap
3	exit	Return to privileged EXEC mode
4	show snmp config	Show the configuration

Use command **no snmp-server enable traps** to stop the switch from sending trap.

3. Configure the switch position

The switch position information `sysLocation` is a variable of MIB system group, which is used to describe

the physical position of the switch.

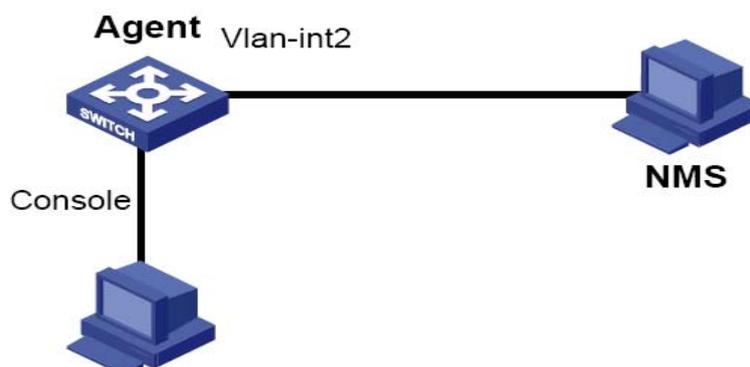

Step	Command	Description
1	config	Enter global configuration mode
2	snmp-server location <i>sysLocation</i>	Configure the switch position <i>sysLocation</i> : specify the switch physical position, the type is character stream
3	exit	Return to privileged EXEC mode
4	show snmp config	Show the configuration

18.2.7 Monitoring and maintenance

Step	Command	Description
1	show snmp community	Show SNMP community information
2	show snmp host	Show IP address of trap target host computer.
3	show snmp config	Show the SNMP engine ID, network administrator contact method, the position of the switch and whether TRAP is enabled.
4	show snmp view	Show view information
5	show snmp access	Show all the names of access group and the attributes of access group.
6	show snmp group	Show all the mapping relationship from user to access group.
7	show snmp user	Show the user information, authentication and encryption information.
8	show snmp statistics	Show SNMP statistics information

18.2.8 Typical configuration example

The interview control configuration example of V3:

First, set the local switch IP address to 20.0.0.10, user *guestuser1*, uses md5 identification algorithm, with

the identification password raisecom, to interview the figure of MIB2, including all the MIB variable under 1.3.6.1.x.1, create guestgroup interview group, the safe mode safe model is usm, the safe grade is identified but not encrypted, the readable figure name is MIB2, thus the process of *guestuser1* mapping to interview group with the safe grade usm can be accomplished, and the result will be shown:

```
Raisecom#config
```

```
Raisecom(config)# interface ip 0
```

```
Raisecom(config-ip)#ip address 20.0.0.10 1
```

```
Raisecom(config-ip)#exit
```

```
Raisecom(config)#snmp-server view mib2 1.3.6.1.2.1 1.1.1.1.0.1 included

Chapter 19 Cluster

19.1 Cluster management introduction

19.1.1 Cluster definition

Using cluster management function, network administrator can manage several switches through the public IP address of a main switch. The main switch will be command equipment, while other switches under administration will be member equipments. The member equipment will not be configured IP address usually, use management equipment redirection to manage and maintain the member equipments.

19.1.2 Cluster role

The position and function of the switch are different in the cluster, so different switch has different role in the cluster. The switches can be commander, member and candidate.

- Commander equipment: the commander has public IP address, provides the management interface for all the switches in the cluster. Commander uses command redirection to manage the members: users send the management command to the commander through public network, and the commander will handle the command, if the commander finds that this command is for other members it will send the commands to members. Commanders have the functions: discover neighbor Raisecom switches, collect the network topology, cluster management, maintaining cluster status, and support different proxy.
- Member equipment: cluster members do not have IP address. User uses the command redirection function to manage the device. Member device has the functions including discovering neighbor, receiving the management info of commander, executing the proxy command, failure/log report function. Once the member is active, it can be managed by network commander.
- Candidate equipment: the switch does not join any cluster but do have cluster capability, it can be member.

19.1.3 Cluster principle

There are three main cluster protocols: RNDP (Raisecom Neighbor Discover Protocol), RTDP (Raisecom Topology Discover Protocol) and RCMP (Raisecom Cluster Management Protocol). RNDP is in charge of neighbor discovery and information collection, RTDP is in charge of the collecting and processing topology information, RCMP is in charge of the functions like adding, active, and deleting cluster members. RTDP and RCMP protocol communicate with each other in VLAN 2. So if there is no such a device that supports Raisecom cluster management functions between two cluster management devices. It needs proper configuration for VLAN2 to make sure normal communication between RTDP and RCMP.

Each cluster has to designate a commander. When commander is designated, it can discover candidates by RNDP and RTDP.

When candidate is added to the cluster, it becomes a member; user has to active this switch by cluster management function, or by configuring automatically active function on the switch to active the cluster function.

19.2 Configure RNDP function

19.2.1 Default RNDP function configuration

By default, the command configuration is as follows:

Function	Default configuration
Enable/disable global RNDP function	Enable the switch RNDP and all the port's RNDP

19.2.2 Configure RNDP function

19.2.2.1 Enable global RNDP

In global configuration mode enable or disable global RNDP function, by default the system RNDP function is enabled, all the ports take part in RNDP judgment and discovery.

Step	Command	Description
1	config	Enter global configuration mode
2	rndp {enable disable}	Enable/disable RNDP globally
3	exit	Return to privileged EXEC mode
4	show rndp	Show RNDP configuration

19.2.2.2 Enable RNDPP port

To enable/disable port RNDP function in port configuration mode, by default all the ports take part in RNDP judgment and discovery.

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <1-26>	Enter port configuration mode
3	rndp {enable disable}	Enable/disable port RNDP
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show rndp	Show RNDP configuration

19.2.3 Monitoring and maintenance

Use command **show** to monitor and maintain RNDP.

Command	Description
show rndp	Show RNDP configuration information
show rndp neighbor	Show RNDP neighbor information

19.2.4 Typical configuration example

Topology structure is as follows:

Fig 1 topology structure

As is shown in figure 1, connect SwitchA and SwitchB, enable all the ports RNDP for SwitchA, enable all the ports RNDP for SwitchB.

SwitchA configuration is show below:

```
Raisecom#config
```

```
Raisecom(config)#interface range 1-26
```

```
Raisecom(config-range)#rndp enable
```

```
Raisecom(config-range)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show rndp
```

```
Raisecom#show rndp neighbor
```

```
Global RNDP feature: Enabled
```

```
Participant ports: 1-26
```

<i>MAC Address</i>	<i>LocalPort</i>	<i>RemotePort</i>	<i>SysID</i>	<i>Hostname</i>
000E.5E03.5318	6	4	6001E	ISCOM2926

SwitchB configuration is as follows:

```
Raisecom#config
```

```
Raisecom(config)# rndp enable
```

```
Raisecom(config)#interface range 1-26
```

```
Raisecom(config-range)#rndp enable
```

```
Raisecom(config-range)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show rndp
```

```
Raisecom #show rndp neighbor
```

```
Global RNDP feature: Enabled
```

```
Participant ports: n/a
```

MAC Address	LocalPort	RemotePort	SysID	Hostname

000E.5E00.C8D9	4	6	60002	ISCOM3026

19.3 RTDP function configuration

19.3.1 Default RTDP function configuration

By default, the command configuration is as follows:

Function	Default configuration
Enable/disable RTDP collection function	Disabled
RTDP collection range	The maximum RTDP collection range is 16 hop.

19.3.2 RTDP function configuration

19.3.2.1 Enable RTDP

Under global configuration mode, user can enable or disable RTDP function, RTDP is disabled by default. If RTDP is enabled, RTDP will collect all the information of Raisecom switch which RNDP function is enabled.

Step	Command	Description
1	config	Enter global configuration mode
2	rtdp {enable disable}	Enable or disable RTDP collection.
3	exit	Exit to privilege EXEC mode.
4	show rtdp	Show RTDP collection.

19.3.2.2 RTDP collection range

In global configuration mode, configure RTDP collection range, by default RTDP can collect the equipment information within 16 hop.

Step	Command	Description
1	config	Enter global configuration mode
2	rtdp max-hop <1-16>	Configure RTDP collection range
3	exit	Return to privileged EXEC mode
4	show rtdp	Show RTDP configuration

19.3.3 Monitoring and maintenance

Use command **use** to monitor and maintain RTDP.

Command	Description
---------	-------------

show rtdp	Show RTDP configuration information
show rtdp device-list [HHHH.HHHH.HHH <i>hostname</i>] [detailed]	Show RTDP discovery equipment list information

19.3.4 Typical configuration example

The topology structure is shown below:

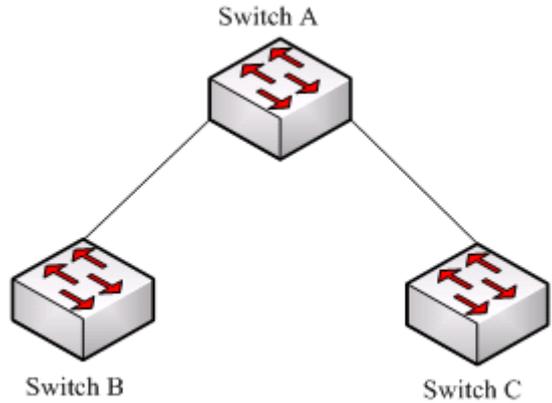

Fig 2 topology structure

As is shown in figure 2, connect the port of SwitchA with the port of SwitchB and SwitchC respectively, on SwitchA configure RTDP enabled and the collection range to 3, configure SwitchB to RTDP enabled, SwitchC to RTDP disabled.

SwitchA configuration is as follows:

```

Raisecom#config
Raisecom(config)#rtdp enable
Raisecom(config)#rtdp max-hop 3
Raisecom(config) #exit
Raisecom #show rtdp
Raisecom#show rtdp device-list detailed
  
```

```

RTDP max-hop: 3
RTDP collecting feature: Enabled
RTDP reporting feature: Enabled
  
```

-Device adjacency information:

Mac Address LocalPort RemotePort

000E.5E03.5318 4 6

000E.5EBD.5951 8 2

SwitchC configuration is as follows:

Raisecom#**config**

Raisecom(config)#**rtdp** *disable*

Raisecom(config) #**exit**

Raisecom #**show rtdp**

RTDP max-hop: 16

RTDP collecting feature: Disabled

RTDP reporting feature: Enabled

19.4 Cluster management function configuration

19.4.1 Default cluster management function configuration

Command	Default configuration
Disable or enable cluster management	Disable cluster management function
Disable or enable cluster management	Automatically active function disabled
Configure the MAC address of automatically active command switch	Default configuration is 0000.0000.0000.

19.4.2 Cluster management equipment function configuration

19.4.2.1 Enable/disable cluster management

By default system cluster management is disabled. With the steps below user can disable/enable cluster management, the command is used in the switch that has been command device.

Step	Command	Description
------	---------	-------------

1	config	Enter global configuration mode
2	cluster	Enable cluster management function
3	exit	Return to global configuration mode
4	exit	Return to privileged EXEC mode
5	show cluster	Show cluster related information

19.4.2.2 Enable automatically active function

By using automatically active function and the configuring MAC address of the command switch that automatically active belongs to, when the equipment has connected to the network, it can be activated by the command switch it belongs to automatically. By default the system automatically active function is disabled. Follow the steps below to enable or disable automatically active function:

Step	Command	Description
1	config	Enter global configuration mode
2	[no] cluster-autoactive	Disable/enable automatically active function
3	[no] cluster-autoactive commander-mac HHHH.HHHH.HHHH	Configure the MAC address of the command switch that automatically function belongs to
4	exit	Return to privileged EXEC mode
5	show cluster	Show cluster related information

19.4.3 Cluster member equipment function configuration

Add and active all the candidate member

For the convenience of user add and active operation to cluster member, the command allows user to use the same username and password to add & active, or add and active all the candidate members that is configured automatically active function by the command switch, and add & active all the candidate member one by one driven by commands.

Step	Command	Description
1	config	Enter global configuration mode
2	cluster	Enter cluster management mode Add all the candidate member;
3	member auto-build [{ active username password}] { active username password all}]	Active means activate all the candidate members; Username activated user's uername; Password activated user's password; All add and activate all the members
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show cluster member	Show cluster member related information.

Notice: Automatically add and activate all the candidate members that are configured activated by current command switch, the members can use command **member auto-build**. With the command, use **member**

auto-build active *username password* to add and activate all the candidate members one by one. Use command **member auto-build active** *username password all*.

19.4.4 Add and activate cluster member

In cluster management mode, user can add the equipment that needs cluster management and activate it. When the equipment is added into the cluster but not activated, it can not manage the equipment the equipment through cluster management function. User can follow the steps below to add member to the cluster and activate it.

Step	Command	Description
1	config	Enter global configuration mode
2	cluster	Enter cluster management mode
3	member <i>HHHH.HHHH.HHHH</i> active [<i>username password</i>]	Add a candidate member to the cluster; Active: activate the added equipment Username: activate the username that the equipment uses; Password: the password that is used to activated the quipment;
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show cluster member <i>[HHHH.HHHH.HHHH]</i>	Show cluster member related information

19.4.5 Delete and suspend cluster member

19.4.5.1 Delete cluster member

In cluster management mode, user can delete the equipment that needs not cluster management. Follow the steps below to delete cluster member:

Step	Command	Description
1	config	Enter global configuration mode
2	cluster	Enter cluster management mode.
3	no member <i>{HHHH.HHHH.HHHH all}</i>	Delete one or all the members; HHHH.HHHH.HHHH: the member's MAC address that will be deleted. All: delete all the members;
4	exit	Exit to global configuration mode.
5	exit	Exit to privilege EXEC mode
6	show cluster member	Show cluster member information

19.4.5.2 Suspend cluster member

In cluster management mode, user can suspend the member which is in active mode, but it has not been deleted from the cluster. When the device is suspended, user cannot manage the device by cluster management any more. Follow the steps below to active cluster member:

Step	Command	Description
1	config	Enter global configuration mode.
2	cluster	Enter cluster management mode
		Suspend cluster member.
3	member <i>HHHH.HHHH.HHHH</i> suspend	<i>HHHH.HHHH.HHHH</i> : stands for the MAC address of the device that will be suspended. Suspend is the key word to be suspended.
4	exit	Exit to global configuration mode.
5	exit	Exit to privilege EXEC mode.
6	show cluster member	Show cluster member information.

19.4.6 Cluster member remote access

In cluster management mode, user can remotely manage the members which have been active, refer following commands:

Step	Command	Description
1	config	Enter global configuration mode
2	cluster	Enter cluster management mode
3	rcommand { <i>hostname</i> <i>HHHH.HHHH.HHHH</i> }	Login cluster member, the hostname is the member name, <i>HHHH.HHHH.HHHH</i> is the MAC address of the member.

19.4.7 Monitoring and maintenance

Use command **show** to realize the monitoring and maintenance of cluster management function.

Step	Command	Description
1	show cluster	Show cluster information
2	show cluster member <i>[HHHH.HHHH.HHHH]</i>	Show cluster member information
3	Show cluster candidate	Show cluster candidate information

Use show cluster to check current cluster relevant information:

Raisecom# **show cluster**

Use **show cluster member** [*HHHH.HHHH.HHHH*] to check particular cluster member or all the member information:

Raisecom# **show cluster member**

Use **show cluster candidate** to check candidates' information:

```
Raisecom# show cluster candidate
```

19.4.8 Typical configuration example

The topology structure is shown below:

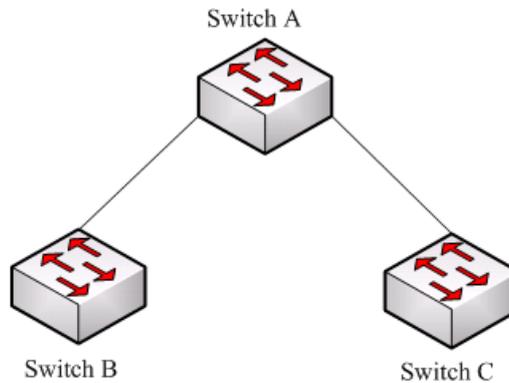

Fig 3 topology structure

As is shown in figure 3, SwitchA is set to cluster manager, SwitchB and SwitchC are added to cluster member. User can land to SwtichB and SwtichC on Switch.

SwitchA configuration is as follows:

```
Raisecom#config
```

```
Raisecom(config)#rndp enable
```

```
Raisecom(config)#interface range 1-26
```

```
Raisecom(config-range)#rndp enable
```

```
Raisecom(config-range)#exit
```

```
Raisecom(config)#rtdp enable
```

```
Raisecom(config)#cluster-autoactive
```

```
Raisecom (config)#cluster
```

```
Raisecom (config-cluster)# member auto-build active all raisecom
```

```
Raisecom (config-cluster)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom #show cluster
```

```
Raisecom#show cluster member
```

```
Identity:Commander
```

```
Current member number:2
```

```
Max member number:128
```

```
MAC Address      Operation      State      Hostname
```

```
-----
```

000E.5EBD.5951	Up	Active	ISCOM2009
000E.5E03.023C	Up	Active	IS2926-53

SwitchB configuration is as follows:

Raisecom#**config**

Raisecom(config)#**rndp enable**

Raisecom(config)#**interface range 1-26**

Raisecom(config-range)#**rndp enable**

Raisecom(config-range)#**exit**

Raisecom(config)#**rtdp enable**

20.1 System log function introduction

20.1.1 System log function overview

The switch system information and some debugging output will be sent out for log handling, which will decide the destination that the log information will be sent according to the system log configuration: log files, console, TELNET, log host.

20.1.2 System log format

The format of system log is:

timestamp module-level- Message content

For example: FEB-22-2005 14:27:33 CONFIG-7-CONFIG: USER "raisecom" Run "logging on".

20.2 Configure system log function

20.2.1 Default system log configuration

Function	Default value
Set the log information to export to the console	Console the direction of the log host is enabled; Output scale is informational.
Set the log information to export to file	Enable the output of the log on file direction
Configure log host	The configuration information without log host
Configure the log exporting to monitor	Monitor the direction of log host is disabled
Enable/disable system log	Enable
Log rate configuration	The sending rate without the limit of logs
Configure the time stand of the log information	Use standard time

20.2.2 Configure system log source

20.2.2.1 Enable/disable system log

Step	Command	Description
1	config	Enter global configuration mode
2	logging on	Enable system log
3	exit	Return to privileged EXEC mode

For example:

Raisecom#**config**

Configuration mode, one command input per times. End with CTRL-Z.

CONFIG-I:Configured from console ...

Raisecom(config)#**logging on**

set successfully!

Raisecom(config)#**exit**

Raisecom#**show logging**

Syslog logging:Enable, 0 messages dropped, messages rate-limited 0 per second

Console logging:Enable, level=informational, 0 Messages logged

Monitor logging:Disable, level=informational, 0 Messages logged

Time-stamp logging messages: date-time

Log host information:

<i>Target Address</i>	<i>Level</i>	<i>Facility</i>	<i>Sent</i>	<i>Drop</i>
-----------------------	--------------	-----------------	-------------	-------------

20.2.2.2 Configure the time stand of the log information

Step	Command	Description
1	config	Enter global configuration mode
		Time stamp setting
		<i>standard: standardtime mmm-dd-yyyy hh-mm-ss, for example "FEB-22-2005 14:27:33"</i>
2	logging time-stamp <i>{standard/relative-start/null}</i>	<i>relative-start: switch running time hh-mm-ss, for example "29:40:6" means the switch has been running for 29 hours 40 minutes 6 second</i>
		<i>null: no time stamp in log information</i>
3	exit	Back to privileged EXEC mode
4	show logging	View the configuration

For example:

Raisecom#**config**

Raisecom(config)#**logging time-stamp relative-start**

20.2.2.3 Configure the log rate

Step	Command	Description
1	config	Enter global configuration mode
2	logging rate <1-1000>	Configure the log number sent every second
3	exit	Return to privileged EXEC mode

20.2.3 Configure system log output

20.2.3.1 Log information output to console

Step	Command	Description
1	config	Enter global configuration mode
2	logging console {<0-7>/ alerts/critical/debugging/ emergencies/errors/informational /notifications/warnings} no logging console	Configure and enable log information output to console and the parameter information, use command no to close the log output direction <0-7>log scale alerts immediate action is needed (scale 1) critical critical state (scale 2) Debugging debug the information (scale 7) emergencies system not available (scale 0) errors errors (scale 3) Informational inform the event (scale 6) notifications normal event in the critical condition (scale 5) Warnings warning condition (scale 4)
3	exit	Return to privileged EXEC mode
4	show logging	Show the configuration

20.2.3.2 Configure the log host

Step	Command	Description
1	config	Enter global configuration mode
2	logging host A.B.C.D {local0 /local1/local2/local3/local4 /local5/local6/local7} {<0-7>/ alerts/critical/debugging/ emergencies/errors/ informational/notifications/war nings} no logging host A.B.C.D	Configure and enable log information output to console and the parameter information, use command no to close the log output direction. Local0-local7 the name of log host equipment <0-7>log scale alerts immediate action is needed (scale 1) critical critical state (scale 2)

		Debugging debug the information (scale 7)
		emergencies system not available (scale 0)
		errors errors (scale 3)
		Informational inform the event (scale 6)
		notifications normal event in the critical condition (scale 5)
		Warnings warning condition (scale 4)
3	exit	Return to privileged EXEC mode
4	show logging	Show the configuration

20.2.3.3 Configure the log information to the file

Step	Command	Description
1	config	Enter global configuration mode
2	logging file no logging file	Configure and start recording the log information into flash files, use command no to close the log output direction
3	exit	Return to privileged EXEC mode
4	show logging	Show the configuration

20.2.3.4 Configure the log output to monitor

Step	Command	Description
1	config	Enter global configuration mode
2	logging monitor {<0-7> alerts/critical/ debugging/emergencies/errors/ informational/notifications/ warnings} no logging monitor	Configure and enable log information output to console and the parameter information, use command no to close the log output direction <0-7>:log scale <i>alerts</i> : immediate action is needed (scale 1) <i>critical</i> : critical state (scale 2) <i>debugging</i> : debug the information (scale 7) <i>emergencies</i> : system not available (scale 0) <i>errors</i> : errors (scale 3) <i>informational</i> : inform the event (scale 6) <i>notifications</i> : normal event in the critical condition (scale 5) <i>warnings</i> : warning condition (scale 4)
3	exit	Return to privileged EXEC mode
4	show logging	Show the configuration

20.2.4

Monitoring and Maintenance

Use command **show** to monitor and maintain log function

Command	Description
show logging	Show the configuration
show logging file	Show the log file content

For example:

Use **show logging** to look over the current log configuration state:

Raisecom# **show logging**

Syslog logging:Enable, 0 messages dropped, messages rate-limited 0 per second

Console logging:Enable, level=informational, 0 Messages logged

Monitor logging:Disable, level=informational, 0 Messages logged

Time-stamp logging messages: date-time

Log host information:

Target Address	Level	Facility	Sent	Drop

Use **show logging file** to look over the log file content:

Raisecom# **show logging file**

0:15:44 CONFIG-7-REBOOT-A:Reboot system by raisecom

0:15:43 CONFIG-7-CONFIG:USER "raisecom" Run "erase"

0:15:43 CONFIG-7-ERASE-A:Erase system configuration file by raisecom

0:15:31 CONFIG-6-LINK_U:port 24 Link UP

0:11:6 CONFIG-6-LINK_U:port 17 Link UP

0:11:4 CONFIG-6-LINK_D:port 17 Link Down

0:10:40 CONFIG-6-LINK_D:port 24 Link Down

0:10:39 CONFIG-6-LINK_U:port 17 Link UP

0:10:37 CONFIG-6-LINK_D:port 17 Link Down

0:10:33 CONFIG-6-LINK_U:port 17 Link UP

0:10:30 CONFIG-6-LINK_D:port 17 Link Down

0:10:29 CONFIG-6-LINK_U:port 17 Link UP

0:7:4 CONFIG-6-LINK_U:port 24 Link UP

0:3:6 CONFIG-7-LOGIN-A:user: raisecom Login

20.2.5 Typical configuration example

Topology structure:

Fig 1 Topology structure

As is shown in fig 1, configure the switch IP address to 20.0.0.6, then start logging function, configure logging host, configure the IP address to 20.0.0.168.

The switch configuration is as follows:

```
Raisecom#config
```

```
Raisecom(config)# interface ip 0
```

```
Raisecom(config-ip)# ip address 20.0.0.6 255.0.0.0 1
```

```
Raisecom(config-ip)#exit
```

```
Raisecom(config)#logging on
```

```
Raisecom(config)#logging time-stamp date-time
```

```
Raisecom(config)#logging rate 2
```

```
Raisecom(config)#logging host 20.0.0.168 local0 warnings
```

```
Raisecom(config)#exit
```

```
Raisecom#show logging
```

```
Syslog logging:Enable, 0 messages dropped, messages rate-limited 2 per second
```

```
Console logging:Enable, level=informational, 16 Messages logged
```

```
Monitor logging:Disable, level=informational, 0 Messages logged
```

```
Time-stamp logging messages: date-time
```

Log host information:

<i>Target Address</i>	<i>Level</i>	<i>Facility</i>	<i>Sent</i>	<i>Drop</i>

20. 0. 0.168	warnings	local0	11	0

PC show logging file:

```
07-01-200811:31:28 Local0.Debug 20.0.0.6 JAN 01 10:22:15 ISCOM3026: CONFIG-7-CONFIG:USER  
"raisecom" Run "logging on"
```

```
07-01-200811:27:41 Local0.Debug 20.0.0.6 JAN 01 10:18:30 ISCOM3026: CONFIG-7-CONFIG:USER  
"raisecom" Run "ip address 20.0.0.6 255.0.0.0 1"
```

07-01-2008 11:27:35 Local0.Debug 20.0.0.10 JAN 01 10:18:24 ISCOM3026: CONFIG-7-CONFIG:USER
"raisecom" Run "ip address 20.0.0.6 255.0.0.1 1"

07-01-2008 11:12:43 Local0.Debug 20.0.0.10 JAN 01 10:03:41 ISCOM3026: CONFIG-7-CONFIG:USER
"raisecom" Run "logging host 20.0.0.168 local0 7"

07-01-2008 11:12:37 Local0.Debug 20.0.0.10 JAN 01 10:03:35 ISCOM3026: CONFIG-7-CONFIG:USER
"raisecom" Run "logging on"

Chapter 21 System Clock

21.1 System clock management overview

Raisecom offers two ways for configuring system time: first, use SNTP protocol to make the switch system time accord with SNMP host time, configure the SNMP protocol time for synchronization to Greenwich time, and turn it to local time according to the system time zone configuration; second, configure the system time manually to local time.

21.2 System clock configuration function

21.2.1 Default system clock configuration

Function	Default value
Default time	2000-01-01 08:00:00
Default time zone excursion	+08:00
Default summer time function	Disable

21.2.2 Configure system clock function

Step	Command	Description
1	clock set <1-24> <0-60> <0-60> <2000-2199> <1-12> <1-31>	Configure system time, in turn they are: hour, minute, second, year, month, day
2	show clock	Show the configuration

21.2.3 Configure time zone management function

Step	Command	Description
1	show clock	Show the configuration
2	clock set <1-24> <0-60> <0-60> <2000-2199> <1-12> <1-31>	Configure system time, in turn they are: hour, minute, second, year, month, day
3	clock timezone {+/-} <0-11> <0-59>	Configure system time zone: +: eastern hemisphere -: western hemisphere <0-11> : time zone excursion, hour <0-59>: time zone excursion, hour

	By default it is Beijing time, that is eastern hemisphere 8h whole.
--	---

21.2.4 Configure summer time function

When summer time configuration is enabled, the time that is accord with SNMP will be transformed into local summer time. The steps are as follows:

Step	Command	Description
1	clock summer-time enable	<p>Enable the summer time function. This function can also be shutdown if you do not need it</p> <p>Configure system time in turn: hour, minute, second, year, month, day</p> <p><1-4>: the starting week, last stands for the last week</p> <p><i>Sun</i>: Sunday <i>Mon</i>: Monday <i>Tue</i>: Tuesday <i>Wed</i>: Wednesday <i>Thu</i>: Thursday <i>Fri</i>: Friday <i>Sat</i>: Saturday</p> <p><1-12> / <i>MONTH</i>: month, <i>MONTH</i> stands for the month that you inputs</p>
2	<p>clock summer-time recurring</p> <p>{<1-4> / last} { sun mon tue wed thu fri sat } {<1-12> / MONTH } <0-23> <0-59> {<1-4> / last} { sun mon tue wed thu fri sat } {<1-12> / MONTH } <0-23> <0-59> <1-1440></p>	<p><0-23>: hour</p> <p><0-59>: minute</p> <p><1-4> / last: ending week</p> <p><i>Last</i>: the last week</p> <p><i>Sun</i>: Sunday <i>Mon</i>: Monday <i>Tue</i>: Tuesday <i>Wed</i>: Wednesday <i>Thu</i>: Thursday <i>Fri</i>: Friday <i>Sat</i>: Saturday</p> <p><1-12> / <i>MONTH</i>: month, <i>MONTH</i> stands for the month that you inputs</p> <p><0-23>: hour</p> <p><0-59>: minute</p> <p><1-4> / last: ending week</p>
3	show clock summer-time recurring	Show summer time configuration

Notice: When configuring the system time manually, if the system uses summer time, then each year April second Sunday morning 2 O' clock to 3 O' clock is not existed. For example, the summer time is set to from

the second Sunday 2:00 am of April to the second Sunday 2:00 am of September each year; when the clock in this time domain is changed one hour faster, or 60 minutes' excursion, then the time between the second Sunday morning 2 and 3am is not existed. The result of manual configuration to the time in this time segment will be failure.

21.2.5 Monitoring and maintenance

Use the following commands to show clock information:

Command	Description
show clock	Show clock information

Use the following commands to show clock information and summer time state:

Command	Description
show clock summer-time-recurring	Show clock summer time

21.2.6 Typical configuration example

Configure the switch time zone and summer time:

```
Raisecom#clock timezone - 10 30
```

```
set successfully!
```

```
Raisecom#clock set 11 14 20 2005 3 28
```

```
set successfully!
```

```
Raisecom#show clock summer-time-recurring
```

```
Current system time: Mar-28-2005 11:15:22
```

```
Timezone offset: -10:30:00
```

```
Summer time recurring: Disable
```

```
Raisecom#clock summer-time enable
```

```
set successfully!
```

```
Raisecom#clock summer-time recurring 2 sun 3 2 0 2 sun 9 2 0 60
```

```
set successfully!
```

```
Raisecom#show clock summer-time-recurring
```

```
Current system time: Mar-28-2005 12:15:53
```

```
Timezone offset: -10:30:00
```

```
Summer time recurring: Enable
```

```
Summer time start: week 02 Sunday Mar 02:00
```

```
Summer time end: week 02 Sunday Sep 02:00
```

```
Summer time Offset: 60 min
```

21.3 Configure SNTP function

21.3.1 Default SNTP protocol configuration

Function	Default value
SNMP server address	Not existed

21.3.2 Configure SNTP protocol function

When SNTP server address is configured, the equipment will try to get clock information from SNTP server every 10 seconds, and the maximum exceeding time of SNTP getting clock information is 10 seconds.

Step	Command	Description
1	config	Enter global configuration mode
2	sntp server A.B.C.D	Configure SNTP server address
3	exit	Return to privileged EXEC mode
4	show sntp	Show the configuration

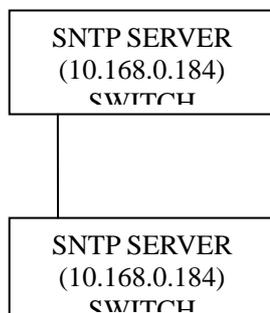

21.3.3 Monitoring and maintenance

Use the following commands to show the switch time management running state and configuration.

Command	Description
show clock	Show clock information

21.3.4 Typical configuration example

For example: the topology structure is shown below:

- Destination:

The switch will get system time from SNTP server

- The configuration steps:

Step 1: show the current default system clock

Raisecom(config)#**show clock**

Current system time: Jan-01-2000 08:00:37

Timezone offset: +08:00:00

Step 2: configure SNTP server address

Raisecom(config)#**sntp server 10.168.0.184**

set successfully!

JUN-15-2008 20:23:55 CONFIG-6-Get SNTP time , Date is Jun-15-2008 Time is 20:23:55

Raisecom(config)#**exit**

Step 3: show SNTP configuration

Raisecom#**show sntp**

SNTP server address:10.168.0.184

<i>SNTP Server</i>	<i>Stratum</i>	<i>Version</i>	<i>Synchronize Time</i>

<i>10.168.0.184</i>	<i>15</i>	<i>1</i>	<i>2008-6-15 20:23:55</i>

Step 4: show current system clock

Raisecom#**show clock**

Current system time: Jun-15-2008 20:24:33

Timezone offset: +08:00:00

Chapter 22 Loopback Detection

22.1 Loopback detection introduction

Loopback detection is to solve the network problem due to Loop (inner loop and outer loop), so as to enhance the network self-diagnostic capability, fault compatibility and robustness.

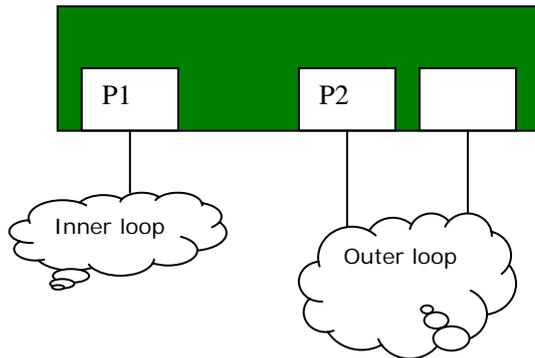

Fig 1

The loop discovery process:

- Each port of the switch sends Loopback-detection packet periodically (the interval is configurable, generally as 4 seconds)
- Switch will check the CUP MAC section of received packet, if the CPU MAC section has the same MAC as the switch, loop exists on certain ports; otherwise, packet will be dropped;
- If the port series number which sends out packed is the same with the port number which receives packets, self loopback exists; otherwise, outer loop exists;
- When loop exists, port with bigger series number will be shutdown;

Notice: When several loops exists, all the ports may be shutdown.

22.2 Default port loopback detection configuration

Command	Default value
Enable/disable loopback detection function	Enable all the ports loopback detection function
Configure the type of loopback detection function and destination address type	Destination MAC will be the broadcasting address
Configure the operation time of port's receiving/sending packet shutdown	The loop can not recover when it is shutdown
Configure the loopback detection time hello time	The hello time time of loopback detection is 4s.

22.3 Configure loopback detection function

Loopback detection function configuration includes the four parts follow:

- Enable/disable loopback detection function
- Configure loopback detection type, or destination address type
- Configure the operation time of loop port receiving/sending packet shutdown
- Configure loopback detection hello time

To enable/disable loopback detection function:

Step	Command	Description
1	config	Enter global configuration function Enable/disable the given port's loopback function. By default it is enabled
2	loopback-detection { <i>enable</i> <i>disable</i> } port-list { <i>port-list</i> <i>all</i> }	<i>Enable</i> , enable loopback detection function <i>Disable</i> , disable loopback detection function <i>port-list</i> physical port number, use ',' and '_' for multi-ports input <i>All</i> all the ports
3	exit	Quit from global configuration mode and enter privileged EXEC mode
4	show loopback-detection	Show port loopback detection state

To configure loopback detection type (destination address type)

Step	Command	Description
1	config	Enter global configuration mode
2	loopback-detection destination-address [<i>mac-address</i> vlan <i>vlan-id</i>]	Configure loopback detection type or destination address type, including unicast packet, multicast packet and broadcast packet. Configure multicast and unicast as pointing to the stable MAC of CPU port and writing into hardware address table. By default it is sending broadcast packet
3	exit	Quit from global configuration mode and enter privileged EXEC mode
4	show loopback-detection	Show port loopback detection state

Configure the operation time of shutting down the receiving/sending packet of the loop port:

Step	Command	Description
1	config	Enter global configuration mode
2	interface port <i>portnumber</i>	Enter physical port configuration mode
3	loopback-detection down-time {<0-65534> <i>infinite</i> }	The operation time of shutting down the receiving/sending packet of the loop port when a loop is detected <0-65534> the time that the loop port is in down state Infinite: the loop port can not recover when disabled
4	exit	Quit from physical port mode and enter global configuration mode

5	exit	Quit from global configuration mode and enter privileged EXEC mode
6	show loopback-detection	Show the port loopback detection state

To configure loopback detection hello-time

Step	Command	Description
1	config	Enter global configuration mode
2	loopback-detection hello-time <1-65535>	Configure loopback detection hello-time. 1-65535, the interval of sending detection packet, unit is second, by default it is 4s;
3	exit	Quit from global configuration mode and enter privileged EXEC mode
4	show loopback-detection	Show port loopback detection state

To restore default configuration use global configuration command: no loopback-detection hello-time.

22.4 Monitoring and maintenance

Show port loopback detection state:

Show loopback-detection

Show loopback detection hello-time, destination address. Showing loopback detection state includes loopback detection function switch states: enable, disable; if there is port loopback: yes, no; port state/shutdown time; the source port that is in the loop with this port.

22.5 Typical configuration example

The topology structure is shown below:

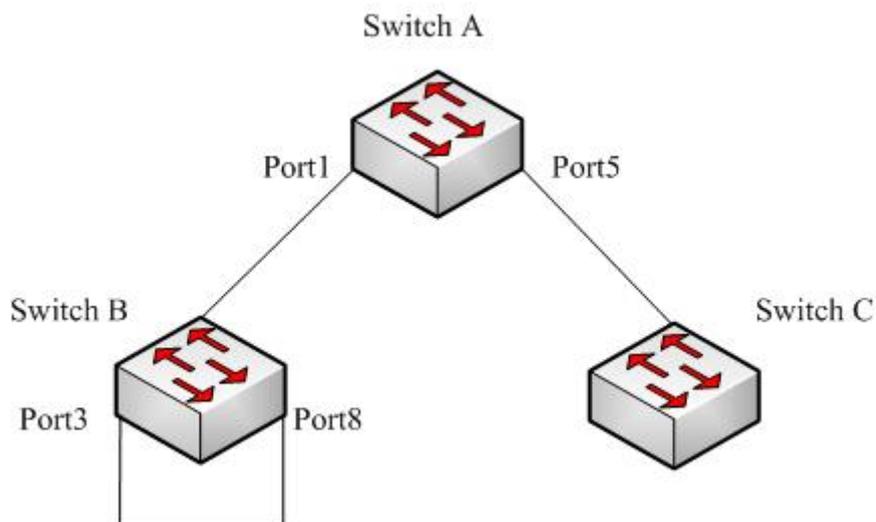

Fig 2 Loopback detection topology structure

As is shown in figure 1, configure Switch2 and Switch3 to loopback detection disable, and configure

Switch1 to loopback detection enabled, when there is loop between Port3 and Port8 of Switch, Switch will detect loop and shut the Port1 of Switch1.

Switch1 configuration is shown below:

Raisecom# **config**

Raisecom(config)# **loopback-detection hello-time 3**

Raisecom(config)# **loopback-detection enable port-list all**

Raisecom(config)# **exit**

Raisecom# **show loopback-detection**

Period of loopback-detection: 3 s

VLAN: 1

Destination address: FFFF.FFFF.FFFF

Port Detection State Loop Flag State/Time Source Port

<i>Port</i>	<i>Detection State</i>	<i>Loop Flag</i>	<i>State/Time</i>	<i>Source Port</i>

Chapter 23 ACL

23.1 Configuration Description

This chapter is suit to configuration ACL function on the following devices: ISCOM2812f/2826/2826e/2828f/2852, ISCOM2926/2924gf, ISCOM3012f/3026/3026e/3028f/3052, ISCOM2250.

23.2 ACL Introduction

In order to filter packets, network equipment needs to set a series of matching rules to identify the filtered objects. Only after this, user can allow or prohibit relative packets to pass through according to the designated strategy in advance. ACL (Access Control list) is used to realize these operations.

ACL can be applied to VLAN, Layer-2 physical port and Layer-3 management interface.

ACL makes classification to packets according to a series of matching conditions; these conditions can be packet source address, destination address and port number etc. It is combined with a series of judgment sentences. After activating a ACL, switch will check each received packet according to the judgment conditions, packets will be forwarded or dropped then according to these conditions.

User can specify *permit* or *deny* while configuring ACLs. When it is set as *deny*, packets that are in accord with the rules will be dropped, the others will be forwarded; when it is set as *permit*, packets that are in accord with the rules will be forwarded, the others will be dropped.

23.3 IP ACL Configuration

Switch supports 400 IP access control lists at most with corresponding series number 0~399. it specifies classification rules according to the source IP address, destination IP address in the IP packet header, used TCP or UDP protocol port number and etc. packet attributes information, and then processes related operations to the packets according these rules. The construction of IP packet header can be referred to RFC791 and other related documents.

23.3.1 IPACL Default Configuration

None.

23.3.2 IPACL Configuration

Steps	Command	Description
1	config	Entry into global configuration mode
2	ip-access-list <i>list-number</i> { <i>deny</i>	<i>ip-access-list</i> : configuration IP address access

	<i>permit</i> } protocol { source-address mask any } [source-protocol-port] { destination-address mask any } [destination-protocol-port]	<p>control list</p> <p><i>list-number</i>: IP address access control list serial number, range from 0-399</p> <p><i>deny / permit</i>: reject/accept access.</p> <p><i>protocol</i> binding protocol type.</p> <p><i>source-address mask</i> any: source IP address with its mask, format is dotted decimal in the form of A.B.C.D, any indicates arbitrary address.</p> <p><i>source-protocol-port</i>: source port for TCP/UDP protocol</p> <p><i>destination -address mask</i> any: is the destination address and its mask, the format is dotted decimal as A.B.C.D; any indicates arbitrary address.</p> <p><i>destination -protocol-port</i>: the destination port of TCP/UPD.</p>
3	exit	Exit global configuration mode and enter privileged EXEC mode
4	show ip-access-list <i>list-number</i>	Show IP access control list relevant information <i>list-number</i> is the series number for the IP access control list to be shown, rang is 0-399.
5	No ip-access-list <i>list-number</i>	Delete IP access control list <i>list-number</i> : the list series number to be deleted

23.3.3 Monitoring and Maintenance

Check and display indicated IP ACL command:

Command	Description
show ip-access-list [{0-399}]	Show IP Access Control List

23.3.4 Specific Configuration Example:

➤ Destination

Configure source IP address as 192.168.1.0 segment, destination IP address as random address , protocol type as IP and access type as deny IP access rule;

Configure source IP address is 10.168.1.19; mask is 255.255.255.255; source protocol port is 80; destination address is random port; protocol type is TCP; visit type is deny IP access rule.

Configure source IP address is 10.168.1.19; mask is 255.255.255.255; destination address is 10.168.0.0 segment; protocol type is TCP; access type is permit's IP access rule.

➤ Set up Steps

Raisecom#**config**

Raisecom(config)#**ip-access-list 0 deny ip 192.168.1.0 255.255.255.0 any**

```
Raisecom(config)#ip-access-list 1 deny tcp 10.168.1.19 255.255.255.255 80 any
```

```
Raisecom(config)#ip-access-list 2 permit tcp 10.168.1.19 255.255.255.255 80 10.168.0.0 255.255.0.0 80
```

```
Raisecom(config)#exit
```

```
Raisecom#show ip-access-list
```

Src Ip: Source Ip Address

Dest Ip: Destination Ip Address

<i>List</i>	<i>Access</i>	<i>Protocol</i>	<i>Ref.</i>	<i>Src Ip:Port</i>	<i>Dest Ip:Port</i>
0	deny	IP	0	192.168.1.0:0	0.0.0.0:0
1	deny	TCP	0	10.168.1.19:80	0.0.0.0:0
2	permit	TCP	0	10.168.1.19:80	10.168.0.0:80

23.4 MAC ACL Function

Switch supports 400 digital-identified Layer-2 (MAC) access control lists at most with corresponding series number 0~399. Layer-2 access control list in conjunction with filter can process relevant operations to packets according to the source MAC address carried in Layer-2 frame, destination MAC address, source VLAN ID, Layer-2 protocol types and other Layer-2 information rules.

23.4.1 MAC ACL Default Configuration

None.

23.4.2 MAC ACL Configuration

Steps	Command	Description
1	config	Entry into global configuration mode
2	mac-access-list <i>list-number</i> { deny permit } [<i>protocol</i> / any] { <i>source-MAC-address</i> any } { <i>destination-MAC-address</i> / any }	MAC access control list configuration <i>list-number</i> : access control list series number, range 0-399. <i>deny/permit</i> : indicates deny/permit access [<i>protocol</i> any]: indicates bonded protocol type, any indicates unrestricted protocol type. <i>source-MAC-address</i> : indicates the source MAC address to be configured, format is hexadecimal string as “HHHH.HHHH.HHHH”, dotted every 4 characters; any indicates arbitrary source MAC address. <i>destination-MAC-address</i> : the destination MAC address to be configured, format is hexadecimal string as “HHHH.HHHH.HHHH”, dotted every 4 characters; any indicates arbitrary destination MAC address.
3	exit	Exit global configuration mode and enter privileged EXEC mode

4	show mac-access-list <i>list-number</i>	Show MAC access control list <i>list-number</i> : is the series number for the MAC access control list to be shown, rang is 0-399.
5	no mac-access-list <i>list-number</i>	Delete configured MAC access control list <i>list-number</i> : the list series number to be deleted

23.4.3 Monitoring and Maintenance

Check and display indicated MAC ACL command:

Command	Description
show mac-access-list <i>[[0-399]]</i>	Display MAC access control list

23.4.4 Specific Configuration Examples

➤ Destination

Configure source MAC address as 1234.1234.1234; destination MAC address as 5678.5678.5678; protocol as IP; access type as deny's MAC access rule;

Configuration source MAC address as 1111.2222.3333; destination MAC address as 4444.5555.6666; protocol as ARP; access type as permit's MAC access rule.

➤ Set up Steps

Raisecom#**config**

Raisecom#**config**

Raisecom(config)# **mac-access-list 0 deny ip 1234.1234.1234 5678.5678.5678**

Raisecom(config)# **mac-access-list 1 permit arp 1111.2222.3333 4444.5555.6666**

Raisecom(config)#**exit**

Raisecom#**show mac-access-list**

Src Mac: Source MAC Address

Dest Mac: Destination MAC Address

<i>List</i>	<i>Access</i>	<i>Protocol</i>	<i>Ref.</i>	<i>Src Mac</i>	<i>Dest Mac</i>
0	deny	ip	0	1234.1234.1234	5678.5678.5678
1	permit	arp	0	1111.2222.3333	4444.5555.6666

23.5 MAP ACL Function

Switch supports 400 digital-identified access list maps at most with corresponding series number 0~399. Access list map can define more protocols and more detailed protocol character fields than IP access list and MAC access list, also can implement matching to any bytes in the first 64 bytes of Layer-2 frame according to user's definition before corresponding processing to the data packets from matched results. User needs to be familiar with Layer-2 data frame before using user-defined access list map.

Access list map uses command *match* to set the expected matching character field, no conflicts can exist in the same access list map when setting matching character field. Character fields that can be matched are shown below:

- Mac destination address
- Mac source address
- Ethernet protocol type
- CoS
- ARP protocol type
- Hardware address of ARP protocol sender
- Hardware address of ARP protocol receiver
- IP address of ARP protocol sender
- IP address of ARP protocol receiver
- IP protocol destination address
- IP protocol source address
- IP protocol priority
- IP protocol ToS
- IP protocol dscp
- IP protocol segmentation bit
- IP protocol type
- TCP protocol destination port
- TCP protocol source port
- TCP protocol bit
- UDP protocol destination port
- UDP protocol source port
- ICMP protocol information type
- ICMP protocol information code
- IGMP protocol information type

User can also use regular mask and offset to define any byte in the first 64 bytes in data frame, and then compare them with the user-defined rules to obtain the matched data frame, after this user can implement relevant operations. User-defined rules can be certain data fixed attributes, such as that in order to obtain all the TCP packets, user can define the rules as “06”, mask as “FF”, offset as “27”, by using such a method, regular rules and offsets can work together to pick up the segment of TCP protocol number in data frame, then compare it with defined rules to obtain all matched TCP packets.

Attention: Rules should be even hexadecimal, offset includes segment of 802.1Q VLAN TAG even if what the switch receives is untagged packet.

23.5.1 MAP ACL Default Configuration

None.

23.5.2 MAP ACL Configuration

Steps	Command	Description
1	config	Entry into global configuration mode
2	access-list-map <i>list-number</i> {deny permit}	<i>list-number</i> : list serial number, from 0-399 <i>deny</i> / <i>permit</i> deny or permit data packets to go through when matching.
3	match mac {destination source} <i>HHHH.HHHH.HHHH</i>	<i>destination</i> / <i>source</i> match source mac or destination mac

		<i>HHHH.HHHH.HHHH</i> mac address
4	match cos <0-7>	<0-7> match cos value
5	match ethertype <i>HHHH [HHHH]</i>	<i>HHHH[HHHH]</i> match Ethernet type [mask]
6	match { <i>arp</i> <i>eapol</i> <i>flowcontrol</i> <i>ip</i> <i>ipv6</i> <i>loopback</i> <i>mpls</i> <i>mpls-mcast</i> <i>pppoe</i> <i>pppoedisc</i> <i>x25</i> <i>x75</i> }	<i>arp</i> : match ARP protocol <i>eapol</i> : match eapol protocol <i>flowcontrol</i> : match flow control protocol <i>ip</i> : match ip protocol <i>ipv6</i> : match ipv6 protocol <i>loopback</i> : match loopback protocol <i>mpls</i> : matchmpls single cast protocol <i>mpls-mcast</i> : matchmpls group cast protocol <i>pppoe</i> : match pppoe protocol <i>pppoedisc</i> : match pppoe discover protocol <i>x25</i> : match x25 protocol <i>x75</i> : match x75 protocol
7	no match mac { <i>destination</i> <i>source</i> }	Do not match MAC address <i>destination</i> / <i>source</i> : match source mac or destination mac
8	no match cos	Do not match CoS value
9	no match ethertype	Do not match Ethernet type
10	match arp opcode { <i>request</i> <i>reply</i> }	Match arp protocol type <i>request</i> / <i>reply</i> arpprotocol reply /request packet
11	match arp { <i>sender-mac</i> <i>target-mac</i> } <i>HHHH.HHHH.HHHH</i>	Match arp protocol hardware address <i>sender-mac</i> / <i>target-mac</i> : match arp sender/target mac address <i>HHHH.HHHH.HHHH</i> : MAC address
12	match arp { <i>sender-ip</i> <i>target-ip</i> } <i>A.B.C.D [A.B.C.D]</i>	Match arp protocol IP address <i>sender-ip</i> / <i>target-ip</i> sender/target: IPAddress <i>A.B.C.D [A.B.C.D]</i> : Ip address [mask]
13	no match arp opcode	do not match arpprotocoltype
14	no match arp { <i>sender-mac</i> <i>target-mac</i> }	do not match arp protocol hardware address
15	no match arp { <i>sender-ip</i> <i>target-ip</i> }	do not match arpprotocolIPAddress <i>sender-ip</i> / <i>target-ip</i> sender/target IP address
16	match ip { <i>destination-address</i> / <i>source-address</i> } <i>A.B.C.D [A.B.C.D]</i>	Match IP protocol address <i>destination-address</i> / <i>source-address</i> Ip protocol destination/source address <i>A.B.C.D [A.B.C.D]</i> IP address [mask]
17	match ip precedence {<0-7> <i>routine</i> / <i>priority</i> / <i>immediate</i> / <i>flash</i> / <i>flash-override</i> / <i>critical</i> / <i>internet</i> / <i>network</i> }	Match IP priority <0-7>: IP priority value <i>routine</i> : IP priority value 0

		<p><i>priority</i>: IP priority value 1</p> <p><i>immediate</i>: IP priority value 2</p> <p><i>flash</i>: IP priority value 3</p> <p><i>flash-override</i>: IP priority value 4</p> <p><i>critical</i>: IP priority value 5</p> <p><i>internet</i>: IP priority value 6</p> <p><i>network</i>: IP priority value 7</p>

32	no match ip tcp { <i>ack</i> / <i>fin</i> / <i>psh</i> / <i>rst</i> / <i>syn</i> / <i>urg</i> }	<p>do not match TCP protocol bit</p> <p><i>ack</i>: match ACK bit</p> <p><i>fin</i>: match FIN bit</p> <p><i>psh</i>: match PSH bit</p> <p><i>rst</i>: match RST bit</p> <p><i>syn</i>: match SYN bit</p> <p><i>urg</i>: match URG bit</p>
33	match ip udp { <i>destination-port</i> / <i>source-port</i> } { <0-65535> / <i>biff</i> / <i>bootpc</i> / <i>bootps</i> / <i>domain</i> / <i>echo</i> / <i>mobile-ip</i> / <i>netbios-dgm</i> / <i>netbios-ns</i> / <i>netbios-ss</i> / <i>ntp</i> / <i>pim-auto-rp</i> / <i>rip</i> / <i>snmp</i> / <i>snmptrap</i> / <i>sunrpc</i> / <i>syslog</i> / <i>tacacs</i> / <i>talk</i> / <i>tftp</i> / <i>time</i> / <i>who</i> }	<p>Match udp protocol port number</p> <p><i>destination-port</i> / <i>source-port</i>: TCP protocol destination/source port</p> <p><0-65535>: udp port number</p> <p><i>biff</i>: Biff (mail notification, comsat, 512)</p> <p><i>bootpc</i>: bootstrap protocol (BOOTP) client (68)</p> <p><i>bootps</i>: bootstrap protocol(BOOTP) server (67)</p> <p><i>domain</i>: domain name service protocol (53)</p> <p><i>echo</i>: echo protocol (7)</p>

		<p><i>mobile-ip</i>: mobile IP registration (434)</p> <p><i>netbios-dgm</i>: NetBios datagram eservic (138)</p> <p><i>netbios-ns</i>: NetBios name service (137)</p> <p><i>netbios-ss</i>: NetBios session service (139)</p> <p><i>ntp</i>: network time protocol(123)</p> <p><i>pim-auto-rp</i>: PIM Auto-RP (496)</p> <p><i>rip</i>: routing information protocol(520)</p> <p><i>snmp</i>: simple network magagement protocol(161)</p> <p><i>snmptrap</i>: SNMP Traps (162)</p> <p><i>sunrpc</i>: Sun remote procedure call (111)</p> <p><i>syslog</i>: system log (514)</p> <p><i>tacacs</i>: TAC access control system (49)</p> <p><i>talk</i>: talk (517)</p> <p><i>tftp</i>: trivial file transfer protocol(69)</p> <p><i>time</i>: Time (37)</p> <p><i>who</i>: Who service (rwho, 513)</p>
34	no match ip udp { <i>destination-port</i> / <i>source-port</i> }	do not match udp protocol port number <i>destination-port</i> / <i>source-port</i> : TCP protocol destination/sourceport
35	match ip icmp <0-255> [<0-255>]	Match icmp protocol information type <0-255> [<0-255>]: information type[information code]
36	match ip igmp {<0-255> <i>dvmrp</i> / <i>query</i> <i>leave-v2</i> <i>report-v1</i> <i>report-v2</i> / <i>report-v3</i> <i>pim-v1</i> }	Match igmp protocol information type <0-255>: IGMP information type <i>dvmrp</i> : Distance Vector Multicast Routing Protocol <i>leave-v2</i> : IGMPv2 leave group <i>pim-v1</i> : protocol Independent Multicast version 1 <i>query</i> : IGMP member query <i>report-v1</i> : IGMPv1 member report <i>report-v2</i> : IGMPv2 member report <i>report-v3</i> : IGMPv3 member report
37	match user-define <i>rule-string</i> <i>rule-mask</i> <0-64>	Match user-defined segment <i>rule-string</i> : user-defined regular string, must be combined of hexadecimal, no more than 64 bytes. <i>rule-mask</i> : mask rule, used to implement “or” operation with data packet <0-64>: offset, based on dataframe header, and implement “or” operation from the beginning of specified bytes
38	no match user-define	do not match user-defined segment
39	exit	Exit global configuration mode and enter privileged EXEC mode

40	show access-list-map [<i>list-number</i>]	Show port <i>access-list-map</i> <i>list-number</i> is the port access-list-map series number to show, range is 0-399
41	no access-list-map <i>list-number</i>	Delete user-defined access-list-map <i>list-number</i> is the list number to delete

23.5.3 Monitoring and Maintenance

Check and display indicated access control list command:

Command	Description
show access-list-map [<i>{0-399}</i>]	Display access control list map list

23.5.4 Specific Configuration Example

➤ Destination

To filter bytes 123456 from the 40th bytes in the data frame, access type is “deny”. ARP protocol request packet is filtered.

➤ Set up Steps

Raisecom#**config**

Raisecom(config)#**access-list-map 0 deny**

Raisecom(config-aclmap)#**match user-define 123456 ffffff 40**

Raisecom(config-aclmap)#**exit**

Raisecom(config)#**access-list-map 1 permit**

Raisecom(config-aclmap)# **match arp opcode request**

Raisecom(config-aclmap)#**exit**

Raisecom(config)#**exit**

Raisecom#**show access-list-map**

access-list-map 0 deny

Match user-define 123456 ffffff 40

access-list-map 1 permit

Match arp Opcode request

23.6 Application Configuration Based on Hardware ACL

3 steps for using ACL on Layer-2 physical port or VLAN are as follows::

1. Define ACL

Described in section 1.4.

2. Configuration Filter

After setting up ACL, you need to set the filter. Whether the filter is configured successfully depends on if the global status is enabled or not. You can use specific commands to make ACLs effective or to delete the filters that are already take effects. You can user command **no filter** to disable the related rules, if rules have been written in hardware, they will be deleted from the hardware and configurations.

In a physical port or VLAN filter rule can be composed by multi “permit/deny” statements and every statement indicated different size range of data packet. There is a problem of match order while a data packet and access control rule are matching. The match order of access control rule depends on configuration filter rule’s order. The later the order, the higher the priority. If there is conflicts in the rules, high priority will be followed.

There are four kinds of configurations: one is based on switch, one is based on port, on is based from ingress port to egress port, one is based on VLAN. For the filtering rules based on port, you have two options, one of which is based on flow ingress with the other one based on flow egress.

3. Simulate Filter

Use filter command to make the access control rule effect or no effect. Default status is no effect. Once command is configured as effect, not only the earlier configuration filter rules will be effect, but also the later configuration filter rule will effect as well.

23.6.1 Application Default Configuration Based on Hardware ACL

None.

23.6.2 Application Configuration Based on Hardware ACL

➤ Application based on switch

Steps	Command	Description
1	config	Entry into global configuration mode
2	[no] filter (<i>ip-access-list / mac-access-list / access-list-map</i>) { <i>acllist / all</i> }	Set filter based on switch ip-access-list indicates that the filter uses IP access list mac-access-list indicates that the filter uses MAC access list access-list-map indicates that the filter uses user-defined access list map <i>acllist / all</i> access control list series number, all means all the configured access control lists
3	filter (<i>enable / disable</i>)	enable filter function effect enable disable filter function effect disable
4	exit	Exit global configuration mode and enter privileged EXEC mode
5	show filter	Show all filter status

➤ Application based on port

Steps	Command	Description
1	config	Entry into global configuration mode
2	[no] filter (ip-access-list mac-access-list access-list-map) {acllist / all} {ingress / egress} port-list {portlist}	<p>Set filter based on port</p> <p>ip-access-list indicates that the filter uses IP access list</p> <p>mac-access-list indicates that the filter uses MAC access list</p> <p>access-list-map indicates that the filter uses user-defined access list map</p> <p>acllist all access control list series number, all means all the configured access control lists</p> <p>ingress egress means to carry out the filtering on ingress egress</p> <p>port-list the filter is applied to port portlist Physical port list range</p>
3	filter (enable / disable)	<p>enable filter function effect enable</p> <p>disable filter function effect disable</p>
4	exit	Exit global configuration mode and enter privileged EXEC mode
5	show filter	Show all filter status

➤ Based from ingress port to egress port

Steps	Command	Description
1	config	Entry into global configuration mode
2	[no] filter (ip-access-list mac-access-list access-list-map) {all/acllist} from ingress-port to egress-port	<p>Set the filter based from ingress port to egress port</p> <p>ip-access-list indicates that the filter uses IP access list</p> <p>mac-access-list indicates that the filter uses MAC access list</p> <p>access-list-map indicates that the filter uses user-defined access list map</p> <p>acllist all access control list series number, all means all the configured access control lists</p> <p>from to directions</p> <p>ingress-port ingress port</p> <p>egress-port egress port</p>
3	filter (enable/disable)	<p><i>enable</i>: filter function effect enable</p> <p><i>disable</i>: filter function effect disable</p>
4	exit	Exit global configuration mode and enter privileged EXEC mode
5	show filter	Show all filter status

- Application based on VLAN

Steps	Command	Description
1	config	Entry into global configuration mode
2	[no] filter (ip-access-list mac-access-list access-list-map) {all/ aclist} vlan vlanid	<p>Set the filter based on VLAN</p> <p>ip-access-list indicates that the filter uses IP access list</p> <p>mac-access-list indicates that the filter uses MAC access list</p> <p>access-list-map indicates that the filter uses user-defined access list map</p> <p>acclist all access control list series number, all means all the configured access control lists</p> <p>Vlan the filter is applied to VLAN</p> <p>vlanid VLAN ID</p>
3	filter (enable disable)	<p>enable filter fuction effect enable</p> <p>disable filter fuction effect disable</p>
4	exit	Exit global configuration mode and enter privileged EXEC mode
5	show filter	Show all filter status

23.6.3 Monitoring and Maintenance

Check and display all configuration filter status command:

Command	Description
show filter	Display all configuration filter status

23.6.4 Specific Configuration Examples

Example 1:

- Destination

The switch does not allow TCP packet to pass through with destination port 80

- Set up steps

Raisecom#**config**

Raisecom(config)# **ip-access-list 0 deny tcp any any 80**

Raisecom(config)# **filter ip-access-list 0**

Raisecom(config)#**filter enable**

Raisecom(config)#**exit**

Example 2:

- Destination

The switch does not allow ARP packets with the MAC address 000e.3842.34ea to pass through on port 2 to 8.

- Set up Steps

```
Raisecom#config
```

```
Raisecom(config)# mac-access-list 2 deny arp any 000e.3842.34ea
```

```
Raisecom(config)# filter mac-access-list 2 ingress portlist 2-8
```

```
Raisecom(config)#filter enable
```

```
Raisecom(config)#exit
```

Example 3:

- Destination

The switch allows IP packets with the source address in network segment 10.0.0.0/8 to pass through in VLAN 3

- Set up Steps

```
Raisecom#config
```

```
Raisecom(config)# ip-access-list 2 deny ip any any
```

```
Raisecom(config)# ip-access-list 3 permit ip 10.0.0.0 255.0.0.0 any
```

```
Raisecom(config)# filter ip-access-list 2,3 vlan 3
```

```
Raisecom(config)#filter enable
```

```
Raisecom(config)#exit
```

23.7 Configuration Function Based on Software IP ACL

The steps below show how to use software IP ACL on Layer-3 interface:

- 1) Define access control list

Show in section 1.2

- 2) ACL Configuration

Filtering rules on a Layer-3 interface can be combined of one or multiple “permit | deny” sentences, every sentence has different specified packet ranges, so matching order problem may happen when matching one packet and ACL rule. The matching order depends on the orders of configured filtering rules, as the order closer to the back, the higher the priority will be. When conflict happens, high priority will be the benchmark.

23.7.1 Application Default Configuration Based on Software IP ACL

None

23.7.2 Layer-3 Interface Protect Configuration Based on IP ACL

Steps	Command	Description
1	config	Entry into global configuration mode
2	interface ip <0-14>	Enter Layer-3 interface configuration mode
3	[no] ip ip-access-list {all/ aclist}	Set Layer-3 interface filter ip-access-list indicates that the filter uses IP access list aclist all access control list series number, all means all the configured access control lists
4	exit	Exit Ethernet Layer-3 interface configuration mode and enter global configuration mode
5	exit	Exit global configuration mode and enter privileged EXEC mode
6	show interface ip ip-access-list	Show filters status for all interfaces

23.7.3 Monitoring and Maintenance

Check and display configuration filter status command:

Command	Description
show interface ip ip-access-list	Show all filters status for Layer-3 interface

23.7.4 Specific Configuration Example

Example 1:

- Destination

Switch only allow IP packet with 10.0.0.0/8 access

- Set up steps

```
Raisecom#config
```

```
Raisecom(config)# ip-access-list 2 deny ip any any
```

```
Raisecom(config)# ip-access-list 3 permit ip 10.0.0.0 255.0.0.0 any
```

```
Raisecom(config)#interface ip 0
```

```
Raisecom(config-ip)# ip ip-access-list 2,3
```

```
Raisecom(config-ip)#exit
```

```
Raisecom(config)#exit
```

24.1 Configuration Description

This configuration paper is suit to the following situations:

For transceiver device: to guide the user to configuration QoS function except for Policy and class function;

For Switch device: to guide the user to configuration most Qos function on the most Switch device , except for some exception. User can look up the QoS function command one to the QoS function command nine to see the details.

24.2 QoS Introduction

24.2.1 Introduction

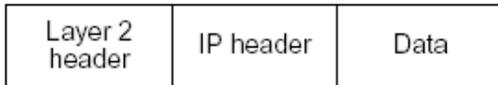

Generally speaking, Internet (Ipv4 standard) provides users only “best effort” service, cannot guarantee a real-time and complete packets transmission, and the quality of services either. Since user always has different requirements for the transmission quality of separate multi-media applications, network resources should be redistributed and scheduled according to user’s demands. By using network quality of service, user is able to process specific data traffic with higher priority, or applies particular management schedule strategy to make the network more predictable and the bandwidth management more effective.

1. QoS Basis

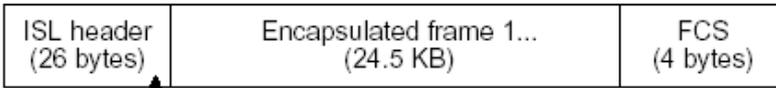

ISCOM2800 mechanism realizes layer-2 packets classification based on 802.1P and 802.1Q standards. 802.1Q defines VLAN, though QoS is not defined in this standard, the given mechanism which mention than the frame precedence can be modified configures a strong groundwork to realize QoS. 802.1P standard defines priority mechanism. If packets with high priority have not been transmitted, packets with low priority will not be transmitted.

In Layer-2 802.1Q frame header, there are 2 bytes of TAG control information string, the first 3 bits carry CoS (Class of Service) value, the values is from 0 to 7, shown in the figure below:

Encapsulated Packet

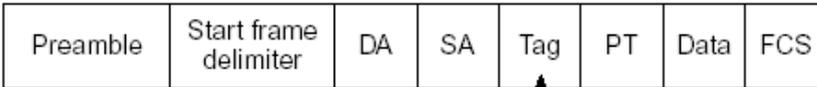

Layer 2 ISL Frame

↑ 3 bits used for CoS

Layer 2 802.1Q/P Frame

↑ 3 bits used for CoS (user priority)

Layer 3 IPv4 Packet

↑ IP precedence or DSCP

The 8 priority defined by CoS can be considered as the following 8 kinds of packets: Priority	Message type	Application
000	Routine	Level 0 corresponds to the default of the best efforts of the information delivery
001	Priority	Level 1 ~ 4 are corresponds for the definition of multi-media data or important enterprise data.
010	Intermediate	
011	Flash	
100	Flash Override	
101	Critical	Level 5 or 6 is used in the sensitive-delay inter-act video/audio data
110	Internet Control	
111	Network Control	Level 7 is applied for the important high-level network data stream, such as routing information

2. QoS basic mode

- ✧ Actions at ingress ports include traffic classification, policing and marking:
 - Classifying: to classify the traffic. This process generates a inner DSCP to identify the data's QoS characteristics.
 - Policing: Comparing inner DSCP and configured policies to determine whether the packet goes into the policy profile or out. Policy limits the occupied bandwidth. The results will be sent to marker.
 - Marking: Evaluates the policy and configuration information for the action to be taken when a packet is out of profile and determines what to do with the packet (pass through a packet without modification, mark down the QoS label in the packet, or drop the packet).
 - ✧ Actions at the egress port include queueing and scheduling:
 - Queueing: evaluates the QoS packet label and the corresponding DSCP before selecting which queues to use. The DSCP value is mapped to an inner CoS value for the selection of an output queue.
 - Scheduling: based on configured WRR (Weighted round robin) and threshold to provide service for output queue.

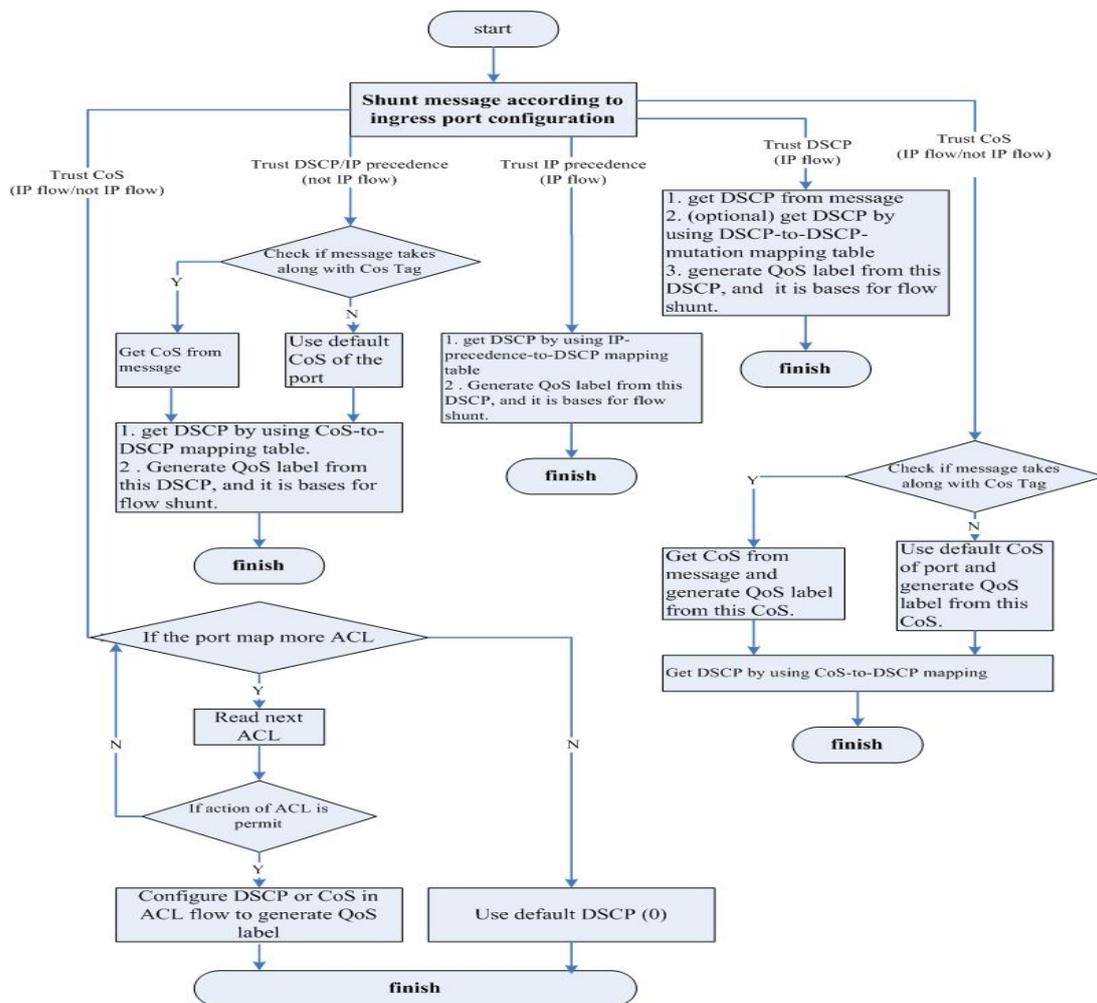

✧ The figure below shows the QoS basic model:

Queuing and scheduling
Actions of ingress

24.2.2 Classification

Classification is the process of distinguishing one kind of traffic from another by examining the fields in the packet. Classification works only when the global QoS function is enabled. QoS is disabled by default. You specify which fields in the frame or packet that you want to use to classify incoming traffic.

Description:

- ✧ For none-IP traffic, the classification procedure is as follows:
 - Use port default value: if the data frame does not have CoS value, assign the incoming frame with the port default Cos value, and then use CoS-to-DSCP map to generate inner DSCP value.

- TRUST the CoS value of input frame (configure the port as TRUST COS): use configurable CoS-to-DSCP mapping table to generate inner DSCP value. For none-IP traffic, whether to configure it as DSCP TRUST and IP precedence TRUST is meaningless, system will use port default CoS value.
- Based on configured Layer-2 MAC ACL classification, check the source MAC, destination MAC and Ethernet field. If there is no configured ACL, assign the default DSCP value as 0. Otherwise, assign DSCP value to the incoming frame based on policy mapping table.
 - ✧ For IP traffic:
 - TRUST IP DSCP value of incoming packets (configure the port as TRUST DSCP): use DSCP of IP packets as the inner DSCP value. You can use DSCP-to-DSCP mapping table to modify the DSCP value if the port is edge port of two QoS domains.
 - TRUST IP precedence of incoming packet (configure the port as TRUST IP precedence): use IP-precedence-to-DSCP mapping table to generate DSCP value.
 - TRUST CoS value of incoming packets: use CoS-to-DSCP mapping table to generate DSCP value.
 - Based on configured IP ACL for classification, check every field in IP packet header. If no ACL is configured, assign the default DSCP value as 0 to the packet. Otherwise, to assign DSCP value to the packet according to policy map.

As described in the diagram, not only we can classify the traffic by different traffic configuration port “TRUST”, and the message CoS, DSCP, IP-precedence; but also we can classify the traffic more flexible by the ACL function, class-map.

Attention: The use of two classification ways are mutually exclusive and later configuration will take effects.

Class-map mechanism describe data flow classification on ACL:

1. Classification based on QoS ACL:

- 1) If a matched permit ACL (the first one) is found, related QoS actions will be activated.
- 2) If a matched deny ACL is found, ignore this one, and go on to the next one.
- 3) If all ACLs are checked but no matched permit ACL, packet will not be processed.
- 4) When matching multiple ACLs, implement QoS processing as the first permit ACL is found.
- 5) After defining an ACL classification, user can bond it to a policy. Policies include class classification (such as aggregation) or rate limiting, bond the policy to a port before taking effects.

2. Classification based on class-map:

A class map is a mechanism that you use to isolate and name a specific traffic flow (or class) from all other traffic. The class map defines the criteria used to match against a specific traffic flow to further classify it:

- 1) by ACL match
- 2) by DCSP, IP priority match.

24.2.3 Policy and Marking

1. Policy map

Each policy may have a lot of class-maps, to identify those flow movements.

2. Policy action

In each policy, different actions identify different flow movements. So far, there are 6 actions:

- ✓ TRUST: the TRUST status of flow as TRUST CoS, DSCP and ToS;

- ✓ Set: modify the data packets of flow into new value include CoS, DSCP, ToS;
 - ✓ Policy: limit the speed of streams and modify them, also notice what actions are going to use if the flow is over speed limit.
 - ✓ Set VLAN: VLAN coverage.
 - ✓ Re-direct to port: redirect message.
 - ✓ Copy-to-mirror:flow image.
3. Policy Application

A policy mapping is needed to binding on the IN/OUT port to be effective.

24.2.4 Bit-Rate Limitation and Reshaping

QoS uses policy for speed limiting and reshaping, also modify the DSCP data packet or byte losing.

1. Three types of policy:

single-policy: each rule of class-map is using this policy individually.

class-policy: all rules of each class-map are sharing this policy.

aggregate-policy: all class-map of one policy-map are sharing this policy.

If the flow bit rate is out profile, each policy will have two actions: either drop or marked down DSCP value.

2. Policy uses token bucket algorithm

When the switch receives a frame, a token will be added on the bucket. According to the indicated average bit rate, each token is added on the bucket after the switch checked the available space on the bucket. If not, the packet will be marked as nonconforming, then follow the policy actions(drop or modify). Moreover, burst will cause the actions as well.

24.2.5 Mapping Table

During QoS processing, switch describes the inner DSCP precedence for all traffics:

1. During the classification procedure, QoS use configured map table (CoS-to-DSCP 、 IP-precedence-to-DSCP), based on the CoS or IP precedence value in the incoming packet to obtain an inner DSCP value; To configure DSCP TRUST status on port, if the DSCP values are different in the two QoS domains, use can use DSCP-to-DSCP-mutation map to modify DSCP value.
2. During the policing procedure, QoS can assign new DSCP values to IP or non-ip packets (if the packet is out of profile and the policy has indicated mark down action), this map is called policed-DSCP mapping.
3. Before traffics go into the scheduling, QoS use DSCP-to-CoS map to obtain CoS value according to inner DSCP value, and then use CoS-to-egress-queue map to select the egress queuing.

Attention: If the map table of DSCP-to-DSCP-mutation and policed-DSCP is empty, the default will be the DSCP value of incoming packet;

DSCP-to-DSCP-mutation mapping table is applied for the port, other mapping tables are applied for the switch.

24.2.6 Queueing and Scheduling

Queueing and scheduling will be carried out for packets processing after policing and marking. ISCOM switch realizes two kinds of processing according to different classified packets:

1. Regenerate packet COS value according to the defined rules while maintaining the packet's native COS value
2. The policy is effective only when the rules are configured as relying on TOS value, that is to say: modify the packet's native COS value according to TOS value.

ISCOM series switches support 4 kinds of priority output queues, the priority values are 0-3. The highest priority is level 3; the switch also supports 3 kinds of queue scheduling policies: strict priority scheduling, control forward weight scheduling and control forward delay scheduling.

ISCOM series switches also support the processing of untagged Layer-2 frame. Every port has default priority which is COS value. When the port receives an untagged packet, the switch will consider the port default priority as the packet's COS value for queue dispatching and scheduling. After the packet goes out of the switch, it will Renew to the original format.

24.2.7 QoS Default Configuration

No.	Attribute	Default configuration
1	QoS enable	Disable
2	Global QoS Trust Status	UNTRUST
3	Port QoS Trust Status	UNTRUST
4	Port Default CoS	0
5	Port Default DSCP	0
6	Port Default CoS override	Disable
7	Port Default DSCP override	Disable
8	class-map match type	match-all
9	Policy Trust Status	DSCP
10	Queue scheduling policy	Strict priority secheduling SP

CoS-DSCP default map:

CoS	0	1	2	3	4	5	6	7
DSCP	0	8	16	24	32	40	48	56

IP-Precedence-DSCP default map:

ToS	0	1	2	3	4	5	6	7
DSCP	0	8	16	24	32	40	48	56

DSCP-CoS default map:

DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
CoS	0	1	2	3	4	5	6	7

DSCP-to-DSCP-Mutation default map(default-dscp):

DSCP	0	1	2	3	4	5	6	7
0	8	9	10	11	12	13	14	15
1	16	17	18	19	20	21	22	23
2	24	25	26	27	28	29	30	31
3	32	33	34	35	36	37	38	39
5	40	41	42	43	44	45	46	47
6	48	49	50	51	52	53	54	55
7	56	57	58	59	60	61	62	63

Inner CoS to queue map:

Inner CoS value	0	1	2	3	4	5	6	7
Queue ID	1	1	2	2	3	3	4	4

24.3 QoS Enable and Disable

24.3.1 QoS Start and Stop Default Configuration

No.	Attributes	Default configuration
1	QoS start	Disable

24.3.2 QoS Start and Close Default Configuration

Under the default situation, QoS is disabled. Use the command below to enable QoS function under global configuration mode.

Step	Command	Description
1	config	Enter global configuration mode
2	mls qos	Enable QoS

3	Exit	Back to privileged EXEC mode
4	show mls qos	Show QoS configuration status

In order to diable QoS, implement command **no mls qos**.

Before enabling QoS, some functions are still effective, such as port default CoS, port default DSCP, queue scheduling mode, CoS to queue map and so on. Users are suggersted to disable the flow control function before enabling QoS.

24.3.3 Monitoring and Maintenance

Command	Description
show mls qos	Show QoS switch status

24.3.4 Configuration Examples

Open QoS function:

Raisecom#**config**

Raisecom(config)#**mls qos**

Raisecom#**show mls qos**

Show as below:

QoS is enabled.

24.4 Classification Function Configuration

24.4.1 Classification Default Configuration

Function	Default Value
Global QoS TRUST status	UNTRUST
Port QoS TRUST status	UNTRUST
Port default CoS	0
Port default DSCP	0
Port default CoS override	Disable
Port default DSCP override	Disable
Class-mapbmatch type	match-all

24.4.2 Flow Classification Configuration Based on Port TRUST Status

Attention:

- Port TRUST status and ACL/Class-map flow classification are mutually exclusive, and later configuration will take effects.

- Global and port QoS TRUST status configurations are used for different devices. So far, it is not capable for those two configurations in one equipment.
- QoS TRUST status configuration and TRUST policy status configuration are mutually exclusive, and later configuration will take effects

24.4.2.1 Configuring Global QoS TRUST status

Configure QoS TRUST status for all ports. Reverse command: **no mls qos TRUST**.

Steps	Command	Description
1	Config	Entry to global configuration mode
2	mls qos TRUST [<i>cos / dscp / ip-precedence</i>]	All QoS TRUST status ports configuration <i>cos</i> : configuration the switch as TRUST CoS status <i>dscp</i> : configuration the switch as TRUST DSCP status <i>ip-precedence</i> : configuration the switch as TRUST IP priority status.
3	Exit	Return to privileges mode
4	show mls qos port	Show QoS port configuration

Configuration example:

```
Raisecom#config
```

```
Raisecom(config)#mls qos TRUST cos //configure port TRUST status
```

```
Raisecom(config)#exit
```

```
Raisecom# show mls qos port

24.4.2.2 Configuring QoS port TRUST status

configure QoS port TRUST status. In default situation, the switch TRUST status is UNTRUST. Reverse Command is: **no mls qos TRUST**.

Steps	Command	Description
1	config	Entry to global configuration mode
2	interface port portid	Entry to port configuration mode
3	mls qos TRUST [<i>cos / dscp</i>]	Set QoS TRUST mode <i>cos</i> : set port as TRUST CoS status

		dscp:set port as TRUST DSCP status
4	Exit	Return to global configuration mode
5	Exit	Return privileges mode
6	Show mls qos port <i>portid</i>	Show QoS port configuration

24.4.2.3 Configuring CoS port default

Only if the port TRUST status is CoS, configuring default CoS takes effects. When the message is untag, CoS default port as CoS value. In default situation, that value will be 0. Reverse command: **no mls qos default-cos**. It can be set under port mode.

Steps	Command	Description
1	config	Entry to global configuration mode
2	interface port <i>portid</i>	Entry to port configuration mode
3	mls qos default-cos <i>cos-value</i>	Set default CoS value CoS-value: set default port CoS value 0-7
4	Exit	Return to global configuration mode
5	Exit	Return to privileges mode
6	Show mls qos port <i>portid</i>	Show QoS port configuration

Configuration example: in Port 1, configure TRUST status as CoS, and when the incoming message is as untag, the CoS value will be 2.

Raisecom#**config**

Raisecom(config)#**inter port 1**

Raisecom(config-port)#**mls qos TRUST cos** //configure port TRUST status

Raisecom(config-port)# **mls qos default-cos 2** //configure CoS port default

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom# **show mls qos port 1**

Show results as:

Raisecom#**sh mls qos port 1**

Port 1:

TRUST state: TRUST CoS

Default CoS: 2

Default DSCP: 0

DSCP override: Disable

DSCP mutation map: default-dscp

24.4.2.4 Configuring default port DSCP

Only if the port TRUST status is DSCP, the default configuration DSCP takes effect. When the incoming message of DSCP is 0, default port DSCP is used as DSCP value. In default situation, that value is 0. reverse command is: `no mls qos default-dscp`. It can be set up in port mode:

Steps	Command	description
1	Config	Entry into global configuration mode
2	Interface <code>port portid</code>	Entry into port configuration mode
3	mls qos default-dscp <code>dscp-value</code>	Set default DSCP value dscp-value: est default port DSCP value as 0-63
4	Exit	Return to global configuration mode
5	Exit	Return to privilege mode
6	show mls qos port <code>portid</code>	Show QoS port configuration mode

The configuration is similar to CoS port default configuration.

24.4.2.5 Configuring port CoS override (Support equipment is not available)

Only if the port TRUST status is CoS, port CoS override configuration takes effect. Whether incoming message is untag or tag, CoS override value is used as CoS value. In Default situation, there will be no override. Reverse command: `no mls qos default-cos override`. It can be set up in port mode:

Steps	Command	Description
1	Config	Entry into global configuration mode
2	Interface <code>port portid</code>	Entry into port configuration mode
3	mls qos default-cos override	Set CoS override value
4	Exit	Return to global configuration mode
5	Exit	Return to privilege mode
6	show mls qos port <code>portid</code>	Show QoS port configuration

24.4.2.6 Configuring port DSCP override

Only if port TRUST status is DSCP,that configuration takes effect. Whatever the incoming message DSCP is, DSCP override value is used as DSCP value. In default situation, there will be no override. Reverse command: `no mls qos default-dscp override`.It can be set in port mode:

Steps	Command	Description
1	Config	Entry into global configuration mode
2	interface <code>port portid</code>	Entry into port configuration mode
3	mls qos default-dscp override	Set default DSCP value
4	Exit	Entry into global configuration mode
5	exit	Return to privilege mode

6	show mls qos port <i>portid</i>	Show QoS port configuration
---	--	-----------------------------

Configuration example: set TRUST status as DSCP in port 1 and port DSCP override value as 2.

```
Raisecom#config
Raisecom(config)#inter port 1
Raisecom(config-port)#mls qos TRUST dscp //set port TRUST status
Raisecom(config-port)# mls qos default-dscp 2
Raisecom(config-port)# mls qos default-dscp override //set port DSCP override value as 2
Raisecom(config-port)#exit
Raisecom(config)#exit
Raisecom# show mls qos port 1
```

Show results:

```
Raisecom#sh mls qos port 1
Port 1:
TRUST state: TRUST DSCP
Default CoS: 0
Default DSCP: 2
DSCP override: Enable
DSCP mutation map: default-dscp
```

24.4.3 Configuring Flow Classification on ACL/class-map

24.4.3.1 Create delete class-map

Class-map is used to isolate the specific data stream, matching conditions include ACL, IP priority and DSCP, VLAN and class.

Creating **class-map** follows the steps below:

Steps	Command	Description
1	config	Entry into global configuration mode
2	Class-map <i>class-map-name</i> [<i>match-all match-any</i>]	Create name as aaa, class-map and entry into config-cmap mode. <i>class-map-name</i> : class-map name, Max 16 characters match-all: satisfy all rules in class match-any: satisfy only one rule in class
3	description <i>WORD</i>	Description of information <i>WORD</i> : description of information in class map, max 255 characters.
4	exit	Return to global configuration mode

5	exit	Return to privilege mode
6	show class-map [WORD]	Show CLASS MAP WORD: class-map name, max 16 characters

Class-map has two matching types: match-all runs AND operation, as multi match statements and operation. If there is conflict, then the match states fail; match-any is run or operation and default is match-all.

Configuration examples:

```
Raisecom#config
```

```
Raisecom(config)# class-map aaa match-all
```

```
Raisecom(config-cmap)# description this-is-test-class
```

```
Raisecom(config-cmap)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show class-map
```

Show results as:

```
Class Map match-all aaa (id 0)
```

```
Description: this-is-test-class
```

```
Match none
```

If **class-map** is needed to delete, run **no**, as **no class-map class-map-name**.

Attention:

- If class-map is quoted by policy in the port, then it is not able to be deleted.
- When matching configuration of class-map is match-all, the configuration may fail because the matching message may have conflicts.
- When a ACL is matched, ACL must be identified and its type must be permit.
- When a class-map is matched, sub class-map must be match-all type.

24.4.3.2 Configuring match statements

Steps	Command	Description
1	config	Entry into global configuration mode
2	class-map class-map-name	Entry into config-cmap mode <i>class-map-name</i> : class-map name, max 16 characters
3	match { <i>ip-access-list</i> / <i>mac-access-list</i> / <i>access-list-map</i> } <i>acl-index</i>	Match ACL <i>ip-access-list</i> : match IP access list <i>mac-access-list</i> : match MAC access list <i>access-list-map</i> : match access control list map table <i>acl-index</i> : access control list index
4	match ip dscp {0-63}	Match DSCP value
5	match ip precedence {0-7}	Match ToS value
6	match vlan {1-4094}	Match VLAN

7	match class-map <i>WORD</i>	Match class map WORD: match class-map name, max16 characters
8	exit	Return to global configuration mode
9	exit	Return to privilege mode
10	show class-map [<i>WORD</i>]	Show CLASS MAP WORD: class-map name, max 16 characters

Attention:

- When access control list is matched, ACL must be created first.
- When class map is matched, class-map must be created first.
- If the match type of class-map is match-all, the configuration may fail because there be conflicts in matched messages.
- If the same class-map has been applied for some port, then it is not allowed to modify the match statement.

To delete some match statement:

Steps	Command	Description
1	config	Entry into global configuration mode
2	class-map <i>class-map-name</i>	Entry into config-cmap mode <i>class-map-name</i> : class-map name, max 16 characters
3	no match { <i>ip-access-list</i> / <i>mac-access-list</i> / <i>access-list-map</i> } <i>acl-index</i>	Match ACL <i>ip-access-list</i> : match IP access list <i>mac-access-list</i> : match MAC access list <i>access-list-map</i> : match access control list map ta ble <i>acl-index</i> : access control list index
4	no match ip dscp { <i>0-63</i> }	Match DSCP value
5	no match ip precedence { <i>0-7</i> }	Match ToS value
6	no match vlan { <i>1-4094</i> }	Match VLAN
7	no match class-map <i>WORD</i>	Match class map WORD: Match class-map name, max 16 characters
8	exit	Return to global configuration mode
9	exit	Return to privilege mode
10	show class-map [<i>WORD</i>]	Show CLASS MAP message WORD: class-map name, max 16 characters

Attention: If the class-map has already been applied for some other port, it is not allowed to delete the match statement.

24.4.4 Monitoring and Maintenance

Command	Description
show mls qos port [<i>portlist</i>]	Show QoS port information <i>portlist</i> : port number list
show class-map [<i>WORD</i>]	Show CLASS MAP information <i>WORD</i> : class-map name, max 16 characters

Show QoS port information

Attention: Show different information according to the supports of different equipments. There are the examples for supports of all configurations as show below.

Raisecom#**show mls qos port 1**

```
port 1:
Attached policy-map: aaa
TRUST state: not TRUSTed
default COS: 2
default DSCP: 3
DSCP override: disable
DSCP Mutation Map: aaa
```

If all port information is needed to check:

Raisecom#**show mls qos port**

```
port 1:
Attached policy-map: aaa
TRUST state: not TRUSTed
default COS: 2
default DSCP: 3
DSCP override: disable
DSCP Mutation Map: aaa
```

```
port 2:
Attached policy-map: aaa
TRUST state: not TRUSTed
default COS: 2
default DSCP: 3
DSCP override: disable
DSCP Mutation Map: aaa
```

.....

```
port 26:
```

TRUST state: not TRUSTed
default COS: 0
default DSCP: 0
DSCP override: disable
DSCP Mutation Map: default-dscp

Show QoS class-map information:

Raisecom#**show class-map**

Class Map match-all aaa (id 0)
Match ip-access-list 1
Match ip dscp 2
Match class-map bbb
Match vlan 1

Class Map match-all bbb (id 1)
Match ip-access-list 2

If it is needed to show the specific name of class-map, use commands as below:

Raisecom#**show class-map aaa**

Class Map match-all aaa (id 0)
Match ip-access-list 1
Match ip dscp 2
Match class-map bbb
Match vlan 1

24.4.5 Typical Configuration Examples

Configuration examples: classify the flow and satisfy the flow in aaa condition: in VLAN1, DSCP is 2 and the messages are from 10.0.0.2 and 10.0.0.3.

Raisecom#**config**

Raisecom(config)# **ip-access-list 1 permit ip 10.0.0.2 255.255.255.0 any**

Raisecom(config)# **ip-access-list 2 permit ip any 10.0.0.3 255.255.255.0**

Raisecom(config)# **class-map bbb match-all**

Raisecom(config-cmap)#**match ip-access-list 2**

Raisecom(config)# **class-map aaa match-all**

Raisecom(config-cmap)#**match ip-access-list 1**

Raisecom(config-cmap)#**match ip dscp 2**

```

Raisecom(config-cmap)#match vlan 1
Raisecom(config-cmap)#match class-map bbb
Raisecom(config-cmap)# exit
Raisecom(config)#exit
Raisecom#show class aaa

```

Show results as:

```

Raisecom#show class aaa
Class Map match-all aaa (id 0)
Match ip-access-list 1
Match ip dscp 2
Match class-map bbb
Match vlan 1

```

24.5 Policy and Marking Function Configuration

24.5.1 Policy and Marking Default Configuration

Function	Default value
Policy TRUST status	DSCP

24.5.2 Policy and Marking Configuration

24.5.2.1 Create delete policy-map

Use **policy-map** command to encapsulate and classify the data flow of class-map. Create **policy-map** as the steps below:

Steps	Command	Description
1	Config	Entry into global configuration mode
2	policy-map <i>policy-map-name</i>	Create name as bbb, policy-map and entry into config-pmap mode. policy-map-name: policy map name, max 16 characters
3	description <i>WORD</i>	Description information WORD: policy map description information, max 255 characters
4	Exit	Return to global configuraiton mode
5	Exit	Return to privilege mode
6	show policy-map [<i>WORD</i>]	Show POLICY MAP information WORD: policy map name, max 16 characters

Configuration examples:

```
Raisecom#config
```

```
Raisecom(config)# policy-map bbb
```

```
Raisecom(config)# exit
```

To check whether the configuration is right, use show command:

```
Raisecom#show policy-map
```

```
Policy Map bbb
```

```
Description: this-is-test-policy
```

If it is needed to delete a **policy-map**, use **command no, no policy-map** *policy-map-name*.

Attention:

If a policy-map is applied for other ports, then it is not able to be deleted.

24.5.2.2 Define policy map

To define one or more defined class-map as a policy, following steps below are used:

Steps	Command	Descriptions
1	config	Entry into global configuration mode
2	policy-map <i>policy-map-name</i>	Entry into config-pmap mode <i>policy-map-name</i> : policy map name, max 16 characters
3	class-map <i>class-map-name</i>	Encapsulate cuclass-map aaa into policy aaa, and entry into config-pmap-c mode <i>class-map-name</i> : class-map name, max 16 characters
4	exit	Return to config-pmap mode
5	exit	Return to global configuration mode
6	exit	Return to privilege mode
7	show policy-map [WORD]	Display POLICY MAP information WORD : policy map name, max 16 characters
8	show policy-map class {WORD}	Display POLICY MAP some classification information WORD: class-map name, max 16 characters

One class can be applied for many policy.

Configuration examples:

```
Raisecom#config
```

```
Raisecom(config)# policy-map aaa
```

```
Raisecom(config-pmap)# class-map aaa
```

Raisecom(config-pmap-c)#**exit**

Raisecom(config-pmap)#**exit**

Raisecom(config)# **exit**

To check whether the configuration is right, use show command:

Raisecom#**show policy-map**

Policy Map aaa

Class aaa

To delete class-map from a policy:

Steps	Command	Description
1	config	Entry into global configuration mode
2	policy-map <i>policy-map-name</i>	Entry into config-pmap mode <i>policy-map-name</i> : policy map name, max 16 characters
3	no class-map <i>class-map-name</i>	Delete class-map from policy <i>class-map-name</i> : class-map name, max 16 characters
4	exit	Return privilege mode
5	show policy-map [<i>WORD</i>]	Display POLICY MAP information <i>WORD</i> : policy map name, max 16 characters

Attention: It is not allowed to delete class-map if the policy-map has been applied for some other port.

24.5.2.3 Define policy action

Different actions are used for different data flow in policy, show as below:

Steps	Command	Description
1	config	Entry into global configuration mode
2	policy-map <i>policy-name</i>	Entry into config-pmap mode <i>policy-name</i> : policy map name, max 16 characters
3	Class-map <i>class-name</i>	Encapsulate class-map into policy, and entry into config-pmap-c mode <i>class-name</i> : class-map name, max 16 characters
4	police <i>policer-name</i>	Use policer for the policy data flow for bit-rate limiting and reshaping, check the link for more information: bit-Rate Limitation and reshaping function configuration <i>policer-name</i> : policer name, max 16 characters
5	TRUST [<i>cos / dscp / ip-precedence</i>]	Policy TRUST status, default use DSCP <i>cos</i> : set switch TRUST CoS status <i>dscp</i> : set switch TRUST DSCP status

		<i>ip-precedence</i> : set switch TRUST IP priority
6	set { ip dscp <i>new-dscp</i> ip precedence <i>new-precedence</i> cos <i>new-cos</i> }	Set new value for data flow <i>new-dscp</i> : DSCP value, 0-63; <i>new-precedence</i> : IP priority value, 0-7 <i>new-cos</i> : set CoS value, 0-7
7	set vlan <1-4094>	Set VLAN override
8	redirect-to port <i>to-port</i>	Redirect the ports <i>to-port</i> : redirect the ports numbers
9	copy-to-mirror	Data flow mirror image
10	exit	Return to config-pmap mode
11	exit	Return to global configuration mode
12	exit	Return to privilege mode
13	show policy-map [WORD]	Display POLICY MAP information <i>WORD</i> : policy map name, max 16 characters

Attention:

- So far, policy TRUST (TRUST command) functions are not supported
- Set command and policy TRUST command are mutually exclusive.
- In one class-map, set command can only be configured in one. Later configuration will take effect

Configuration examples:

Raisecom#**config**

Raisecom(config)#**policy-map aaa**

Raisecom(config-pmap)#**class-map aaa**

Raisecom(config-pmap-c)#**police aaa**

Raisecom(config-pmap-c)#**set cos 6**

Raisecom(config-pmap-c)#**set ip dscp 5**

Raisecom(config-pmap-c)#**set ip precedence 4**

Raisecom(config-pmap-c)#**set vlan 10**

Raisecom(config-pmap-c)#**redirect-to port 3**

Raisecom(config-pmap-c)#**exit**

Raisecom(config-pmap)#**exit**

Raisecom(config)#**exit**

Raisecom# **show policy-map aaa**

Show as:

Policy Map aaa

Class aaa

police aaa

set ip precedence 4

set vlan 10
redirect-to port 3

To delete or modify data flow actions:

Steps	Command	Description
1	Config	Entry into global configuration mode
2	policy-map <i>policy-name</i>	Entry into config-pmap mode <i>policy-name</i> : policy map name,max 16 characters
3	class-map <i>class-name</i>	Encapsulate class-map aaa into policy aaa, and entry into config-pmap-c mode <i>class-name</i> : class-map name, max 16 characters
4	no police <i>policer-name</i>	Apply policer in this policy data flow <i>policer-name</i> : policer name, max 16 characters
5	no TRUST [<i>cos</i> / <i>dscp</i> / <i>ip-precedence</i>]	Data flow TRUST status, default use DSCP <i>cos</i> : set switch as TRUST CoS status <i>dscp</i> : set switch as TRUST DSCP status <i>ip-precedence</i> : set switch as TRUST IP priority status
6	no set { <i>ip dscp/ip precedence/cos</i> }	Set new value for data flow <i>new-dscp</i> : DSCP value, 0-63; <i>new-precedence</i> : IP priority value, 0-7 <i>new-cos</i> : set CoS value, 0-7
7	no set vlan	Set VLAN override
8	no redirect-to port	Redirect to port
9	no copy-to-mirror	Data flow mirror image
10	exit	Return to config-pmap mode
11	exit	Return to global configuration mode
12	exit	Return to privilege mode
13	show policy-map [WORD]	Display POLICY MAP WORD: policy map name, max 16 characters

Attention: It is not allowed to modify the action if its policy-map has been applied for other ports

24.5.2.4 Apply policy service-policy in ports

It actually does not take effect after all data flow and policy defined. They need to be applied for the ports. The steps for the apply policy are as below:

Steps	Command	Description
1	config	Entry into global configuration mode
2	service-policy <i>policy-name</i> ingress <i>portid</i> [egress <i>portlist</i>]	Apply policy on in/out port.

		<i>policy-name</i> : policy map name, max 16 characters <i>portid</i> : in port number <i>portlist</i> : out port list
3	exit	Return to privilege mode
4	show policy-map port [<i>portlist</i>]	Display port policy application information <i>portlist</i> : port number

Attention:

- QoS must start before applying policy;
- When the configuring data flow becomes big, it may fail because it may get the biggest rule of capacity based on those 256 rules for 8 ports.
- The TRUST status are mutually exclusive if the TRUST status of the applied front port is not UNTRUST status. After applied, the status will become UNTRUST status.

Application examples:

Raisecom#**config**

Raisecom(config)#**service-policy** *aaa* **ingress** 2 **egress** 1-5

Raisecom(config)#**service-policy** *bbb* **egress** 1

Raisecom(config)#**exit**

Raisecom#**show policy-map port**

Display as:

port 2 on ingress:

Policy Map aaa:

Egerss:1-5

Class Map :aaa (match-all)

port 1 on egress:

Policy Map bbb:

24.5.3 Monitoring and Maintenance

Command	Description
show policy-map [<i>WORD</i>]	Display POLICY MAP information <i>WORD</i> : policy map name, max 16 characters
show policy-map class { <i>WORD</i> }	Display some classified information of POLICY MAP <i>WORD</i> : class-map name, max 16 characters
show policy-map port [<i>portlist</i>]	Display port policy application information <i>portlist</i> : port numbers

1. Display QoS policy-map information

Raisecom#**show policy-map**

Policy Map aaa

Class aaa

police aaa

set ip precedence 4

Class bbb

police aaa

To display the specific name of policy-map information:

Raisecom#show policy-map aaa

Policy Map aaa

Class aaa

police aaa

set ip precedence 4

Class bbb

police aaa

2. Display some classified information of POLICY MAP

If wanted to show specific policy-map name、indicated class-map name information:

Raisecom#show policy-map aaa class-map aaa

Policy Map aaa

Class aaa

police aaa

set ip precedence 4

3. Display QoS policy-map application information

If wanted to check which policy-map information applied on which ports:

Raisecom#show policy-map port 1

port 1:

Policy Map aaa:

Egerss:1-5

Class Map :aaa (match-all)

Class Map :bbb (match-all)

If wanted which policy-map information applied on all ports:

Raisecom#show policy-map port

port 1:

Policy Map aaa:

Egerss:1-5

Class Map :aaa (match-all)

Class Map :bbb (match-all)

24.5.4 Specific Configuration Examples:

```
Raisecom#config
```

```
//Define ACL
```

```
Raisecom(config)# ip-access-list 1 permit ip 10.0.0.2 255.255.255.0 10.0.0.3 255.255.255.0
```

```
Raisecom(config)# ip-access-list 2 permit ip 10.0.0.3 255.255.255.0 10.0.0.2 255.255.255.0
```

```
//classify data flow
```

```
Raisecom(config)# class-map aaa match-all
```

```
Raisecom(config-cmap)#match ip-access-list 1
```

```
Raisecom(config-cmap)# exit
```

```
Raisecom(config)# class-map bbb match-all
```

```
Raisecom(config-cmap)#match ip-access-list 2
```

```
Raisecom(config-cmap)# exit
```

```
//bit-rate limitation and reshapeing definition, details see: bit-Rate Limitation and reshapeing function configuration
```

```
Raisecom(config)#mls qos class-policer p-aaa 4000 100 exceed-action drop
```

```
Raisecom(config)# mls qos class-policer p-bbb 8000 200 exceed-action drop
```

```
//define policy
```

```
Raisecom(config)#policy-map wmj
```

```
Raisecom(config-pmap)#class-map aaa //define data flow classification aaa in policy
```

```
Raisecom(config-pmap-c)# set ip dscp 5 //define policy action---set IP DSCP
```

```
Raisecom(config-pmap-c)#police p-aaa //define policy action——bit-rate limited reshapeing
```

```
Raisecom(config-pmap-c)#exit
```

```
Raisecom(config-pmap)#class-map bbb //define data flow bbb in policy
```

```
Raisecom(config-pmap-c)# set ip dscp 6 //define policy action——set IP DSCP
```

```
Raisecom(config-pmap-c)#police p-bbb //define policy action——bit-rate limited reshapeing
```

```
Raisecom(config-pmap-c)#exit
```

Raisecom(config-pmap)#exit

Raisecom(config)#mls qos

Raisecom(config)#service-policy *wmj ingress 1 egress 2* //apply policy in ports

24.6 Bit-Rate Limitation and Reshaping Function Configuration

24.6.1 Bit-Rate Limitation and Reshaping Default Configuration

None

24.6.2 Configuration Based on Bit-Rate and Reshaping of Data Flow

Create policer as following steps:

Steps	Command	Description
1	config	Entry into global configuration mode
2	mls qos single-policer <i>policer-name rate burst exceed-action {drop policed-dscp-transmit marked-dscp }</i>	Create policer in type of single <i>policer-name</i> : set policer name <i>rate</i> : bit-rate value (Kbps), 8—2000000 <i>burst</i> : Burst value (KBps), 8—512000 <i>drop</i> : dropped packets once it is over bit-rate value <i>policed-dscp-transmit</i> : modified DSCP value once it is over bit-rate value <i>marked-dscp</i> : modified DSCP value once it is over bit-rate value
3	mls qos class-policer <i>policer-name rate burst exceed-action {drop policed-dscp-transmit marked-dscp }</i>	Create policer as type of class <i>policer-name</i> : set policer name <i>rate</i> : bit-rate value(Kbps), 8—2000000kbps <i>burst</i> : burst value (KBps), 8—512000 <i>drop</i> : dropped packets once it is over bit-rate value <i>policed-dscp-transmit</i> : modify DSCP once it is over bit-rate value <i>marked-dscp</i> : modified DSCP value once over bit-rate value
4	mls qos aggregate-policer <i>policer-name rate burst exceed-action {drop policed-dscp-transmit marked-dscp }</i>	Create policer as type of aggregate <i>policer-name</i> : set policer name <i>rate</i> : bit-rate value(Kbps), 8—2000000kbps <i>burst</i> : burst value (KBps), 8—512000 <i>drop</i> : dropped packets once it is over bit-rate value <i>policed-dscp-transmit</i> : modify DSCP once it is over bit-rate value <i>marked-dscp</i> : modified DSCP value once over bit-rate value
5	exit	Return to global configuration mode
6	show mls qos policer [<i>single-policer</i> /	Display policer information

<i>class-policer / aggregate-policer]</i>	<i>single-policer</i> : display single policer <i>class-policer</i> : display class policer <i>aggregate-policer</i> : display aggregate policer
--	--

To delete a policer, use command no, **no** {*single-policer/class-policer/aggregate-policer*} *placer-name*.

Attention: When delete a policer, it is not allowed to delete it if its policy is applied for other ports.

24.6.3 Monitoring and Maintenance

Command	Description
show mls qos policer [<i>single-policer / class-policer / aggregate-policer</i>]	Display policer information <i>single-policer</i> : Display single policer <i>class-policer</i> : Display class policer <i>aggregate-policer</i> : display aggregate policer

Raisecom#**show mls qos policer**

single-policer aaa 44 44 exceed-action policed-dscp-transmit 4

Used by policy map aaa

To show which port is using policer, use the commands below:

Raisecom#**show mls qos port policers**

Port id 1

policymap name: aaa

policer type: Single, name: aaa

rate: 44 kbps, burst: 44 kbyte, exceed action: policed-dscp-transmit, dscp:4

24.6.4 Specific Configuration Examples

Configuration examples:

Raisecom#**config**

Raisecom(config)# **mls qos single-policer aaa 44 44 exceed-action policed-dscp-transmit 4**

Raisecom(config)# **exit**

Raisecom#**show mls qos policer**

Display results as:

single-policer aaa 44 44 exceed-action policed-dscp-transmit 4

Not used by any policy map

If aaa is applied for a port:

Raisecom#**show mls qos port policers**

Port id 1

polycymap name: aaa

policer type: Single, name: aaa

rate: 44 kbps, burst: 44 kbyte, exceed action: policed-dscp-transmit, dscp: 4

24.7 Map Function Configuration

24.7.1 Map Default Configuration

COS-DSCP default configuration relationship as:

CoS value	0	1	2	3	4	5	6	7
DSCP value	0	8	16	24	32	40	48	56

IP-Precedence-DSCP default map relation as:

ToS value	0	1	2	3	4	5	6	7
DSCP value	0	8	16	24	32	40	48	56

DSCP-COS default map relation as:

DSCP value	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
CoS value	0	1	2	3	4	5	6	7

DSCP-to-DSCP-Mutation default map relation (default-dscp) as:

DSCP value	0	1	2	3	4	5	6	7
0	8	9	10	11	12	13	14	15
1	16	17	18	19	20	21	22	23
2	24	25	26	27	28	29	30	31
3	32	33	34	35	36	37	38	39
5	40	41	42	43	44	45	46	47
6	48	49	50	51	52	53	54	55
7	56	57	58	59	60	61	62	63

Internal COS – queuing default map relation as:

Internal CoS value	0	1	2	3	4	5	6	7
Queuing ID	1	1	2	2	3	3	4	4

24.7.1 CoS-DSCP map List Configuration

CoS-DSCP map list maps incoming packet COS value as a DSCP value. QoS is used to describe data flow priority. Its default map relation is as follows:

CoS value	0	1	2	3	4	5	6	7
DSCP value	0	8	16	24	32	40	48	56

To modify the map relations, the following steps are set:

Steps	Commands	Description
1	config	Entry into global configuration mode
2	mls qos map cos-dscp dscp1 dscp2 dscp3 dscp4 dscp5 dscp6 dscp7 dscp8	Set new map relation Dscp1-8: DSCP value
3	exit	Return to privilege mode
4	show mls qos maps cos-dscp	Show QoS COS-DSCP map list

Configuration examples:

Configuration cos-dscp map as 2 3 4 5 6 7 8 9:

Raisecom#**config**

Raisecom(config)# **mls qos map cos-dscp 2 3 4 5 6 7 8 9**

Raisecom(config)#**exit**

Raisecom# **show mls qos maps cos-dscp**

Show results as:

Cos-dscp map:

```
cos:  0  1  2  3  4  5  6  7
```

```
dscp:  2  3  4  5  6  7  8  9
```

To backup COS-DSCP map list to default map relation, use command **no**.

Steps	Command	description
1	config	Entry into global configuration mode
2	no mls qos map cos-dscp	Backup to default map relation
3	exit	Return to privilege mode
4	show mls qos maps cos-dscp	Display QoS COS-DSCP map list

Raisecom#**show mls qos maps cos-dscp**

Cos-dscp map:

```
cos:  0  1  2  3  4  5  6  7
```

dscp: 0 8 16 24 32 40 48 56

24.7.2 IP-Precedence-DSCP Map List Configuration

IP-Precedence-DSCP map-list configuration maps incoming packet ToS into a DSCP value. QoS is used to describe the data flow priority. Its default map relation as show below:

ToS value	0	1	2	3	4	5	6	7
DSCP value	0	8	16	24	32	40	48	56

To modify that map relation, set as the following steps:

Steps	Command	Description
1	config	Entry global configuration mode
2	mls qos map ip-prec-dscp dscp1 dscp2 dscp3 dscp4 dscp5 dscp6 dscp7 dscp8	Set new map relationship Dscp1-8: DSCP value
3	exit	Return to privilege mode
4	show mls qos maps ip-prec-dscp	Display QoS IP-Precedence-DSCP map list

Configuration example:

Configure ip-prec-dscp map as 2 4 6 8 10 12 14 16:

Raisecom#**config**

Raisecom(config)# **mls qos map ip-prec-dscp 2 4 6 8 10 12 14 16**

Raisecom(config)#**exit**

Raisecom# **show mls qos maps ip-prec-dscp**

Show results as:

Ip Precedence-dscp map:

ipprec: 0 1 2 3 4 5 6 7

dscp: 2 4 6 8 10 12 14 16

Backing up IP-Precedence-DSCP map list to default map relation, use command **no**.

Steps	Command	Description
1	config	Entry into global configuration mode
2	no mls qos map ip-prec-dscp	Backup to default map relation
3	Exit	Return to privilege mode
4	show mls qos maps ip-prec-dscp	Show QoS IP-Precedence-DSCPmap list

Raisecom#**show mls qos maps ip-prec-dscp**

Ip Precedence-dscp map:

```
ipprec:  0  1  2  3  4  5  6  7
```

```
-----  
dscp:   0  8  16 24 32 40 48 56
```

24.7.3 DSCP-CoS Map List Configuration

DSCP-CoSmap list maps the incoming packet DSCP value into a cos value. QoS use its description data flow priority. The default map relation is:

DSCP value	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
CoS value	0	1	2	3	4	5	6	7

To modify that map relation, follows the steps below:

Steps	Command	Description
1	Config	Entry into global configuration mode
2	mls qos map dscp-cos dscplist to cos	set new map relation Dscplist: DSCP list Cos: cos value
3	Exit	Return to privilege mode
4	show mls qos maps dscp-cos	Show QoS DSCP- CoSmap list

Configuration examples:

configure **dscp-cos** map, mapping 1-10 into 7:

```
Raisecom#config
```

```
Raisecom(config)# mls qos map dscp-cos 1-10 to 7
```

```
Raisecom(config)#exit
```

```
Raisecom# show mls qos maps dscp-cos
```

show results as:

```
Dscp-cos map:
```

```
d1 : d2  0  1  2  3  4  5  6  7  8  9
```

```
-----  
0:   0  7  7  7  7  7  7  7  7  7  
1:   7  1  1  1  1  1  2  2  2  2  
2:   2  2  2  2  3  3  3  3  3  3  
3:   3  3  4  4  4  4  4  4  4  4  
4:   5  5  5  5  5  5  5  5  6  6  
5:   6  6  6  6  6  6  7  7  7  7  
6:   7  7  7  7
```

Renewing DSCP-CoSmap list to default mapping relation, use command **no**:

steps	command	description
1	config	Entry into global configuration mode
2	no mls qos map dscp-cos	Back to the default mapping relation
3	exit	Return to privilege mode
4	show mls qos maps dscp-cos	showQoS DSCP-CoSmap list

Raisecom#**show mls qos maps dscp-cos**

Dscp-cos map:

d1 : d2 0 1 2 3 4 5 6 7 8 9

0: 0 0 0 0 0 0 0 0 1 1

1: 1 1 1 1 1 1 2 2 2 2

2: 2 2 2 2 3 3 3 3 3 3

3: 3 3 4 4 4 4 4 4 4 4

4: 5 5 5 5 5 5 5 5 6 6

5: 6 6 6 6 6 6 7 7 7 7

6: 7 7 7 7

24.7.4 DSCP-MUTATION Map List Configuration

To get the IP data flow with QoS characters in two independent QoS domain, the ports in the edge of those domains should be set as DSCP TRUST status. Then the receiving port receive the trust DSCP value to avoid QoS classification. If the DSCP values of those two domains are different, they can be converted through DSCP-to-DSCP converting map list.

DSCP-MUTATIONmap list maps the DSCPvalue into a new DSCP value. QoS uses its description data flow priority. There is a default map listdefault-DSCP in the system and this list could not be modified and deleted.

To modify that mapping relation, set the following steps:

Steps	Command	Description
1	config	Entry into global configuration mode
2	mls qos map dscp-mutation <i>dscpname</i> <i>dscplist to dscp</i>	Create new DSCP mapping relation Dscpname: DSCP mutation name Dscplist: output port DSCP Dscp: DSCP value
3	exit	Return to privilege mode
4	show mls qos maps dscp-mutation	showQoS DSCP-MUTATIONmap list

Configuration examples:

Set **dscp-mutation** mapping, map 1-10, 20-30 into 30:

Raisecom#**config**

Raisecom(config)# **mls qos map dscp-mutation aaa 1-10 to 30**

Raisecom(config)# **mls qos map dscp-mutation aaa 20-30 to 30**

Raisecom(config)#**exit**

Raisecom# **show mls qos maps dscp-mutation**

Show results as:

Dscp-dscp mutation map:

default-dscp:

```
d1 : d2  0  1  2  3  4  5  6  7  8  9
-----
0 :      0  1  2  3  4  5  6  7  8  9
1 :     10 11 12 13 14 15 16 17 18 19
2 :     20 21 22 23 24 25 26 27 28 29
3 :     30 31 32 33 34 35 36 37 38 39
4 :     40 41 42 43 44 45 46 47 48 49
5 :     50 51 52 53 54 55 56 57 58 59
6 :     60 61 62 63
```

Dscp-dscp mutation map:

aaa:

```
d1 : d2  0  1  2  3  4  5  6  7  8  9
-----
0 :      0  30 30 30 30 30 30 30 30 30
1 :     30 11 12 13 14 15 16 17 18 19
2 :     30 30 30 30 30 30 30 30 30 30
3 :     30 31 32 33 34 35 36 37 38 39
4 :     40 41 42 43 44 45 46 47 48 49
5 :     50 51 52 53 54 55 56 57 58 59
6 :     60 61 62 63
```

To delete DSCP-MUTATION map list, use command **no**.

steps	command	description
1	config	Entry into global configuration mode
2	no mls qos map dscp-mutation dscpname	Delete DSCP mapping relation Dscpname: DSCP mutation name
3	exit	Return to privilege mode
4	show mls qos maps dscp-mutation	showQoS DSCP-CoSmap list

To apply the map list for DSCP-mutation, it could be used in port mode. Port default uses default-dscp mapping relation.

steps	command	description
1	config	Entry into global configuration mode
2	interface port <i>portid</i>	Entry into port mode
3	mls qos dscp-mutation <i>dscpname</i>	Apply DSCP mapping relation <i>dscpname</i> : DSCP mutation name, max 16 characters
4	exit	Return to configuraton mode
5	exit	Return to privilege mode
6	show mls qos port <i>portid</i>	Show QoS port configuration information

Configuration examples:

```
Raisecom#config
```

```
Raisecom(config)#interface port 1
```

```
Raisecom(config-port)# mls qos dscp-mutation aaa
```

```
Raisecom(config-port)# exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show mls qos port 1
```

To check wether the configuration is right, use command show:

```
Raisecom#show mls qos port 1
```

```
port 1:
```

```
TRUST state: not TRUSTed
```

```
default COS: 0
```

```
default DSCP: 0
```

```
DSCP override: disable
```

```
DSCP Mutation Map: aaa
```

Attention: In ISCOM2800 series, DSCP-MUTATION map list uses filter list to get hardware. In hardware, port 1-8 use same filter list (same as 9–16, 17–24, port 25, port 26 are using one filter list individually, 5 filter list in total). Thus, as any port in port 1-8 is using DSCP-MUTATION map list, the rest ports of port 1–8 are using DSCP-MUTATION map list as well.

To decline DSCP-MUTATION map list application in the port, use command **no**.

Steps	Command	Description
1	config	Entry into global configuration mode
2	interface port <i>portid</i>	Entry into port mode
3	no mls qos dscp-mutation <i>dscpname</i>	Decline using DSCP map relation <i>dscpname</i> : DSCP mutation name, max 16 characters
4	exit	Return to configuration mode

5	exit	Return to privilege mode
6	show mls qos port <i>portid</i>	showQoS port configuration information

To check whether the configuration is right, use command show:

Raisecom#**show mls qos port 1**

port 1:

TRUST state: not TRUSTed

default COS: 0

default DSCP: 0

DSCP override: disable

DSCP Mutation Map: default-dscp

Attention: When dscp-mutationmap list is used in some other port, its map list could not be deleted; only the map list is not used, it could be deleted.

24.7.5 CoS-queue Map List Configuration

CoS-queuemap list is sent to the output queue which is decided by the incoming packet CoS value. QoS uses its description data flow priority, and its default map relation is:

Internal CoS value	0	1	2	3	4	5	6	7
Queue ID	1	1	2	2	3	3	4	4

To modify the map relation, set up with the following relation:

Steps	Command	Description
1	config	Entry into global configuration mode
2	queue cos-map <i>queueid</i> <i>coslist</i>	set new map relation, packets CoS value in 1-4 are sent to Queue 1 Queueid: Queue number Coslist: CoS value
3	exit	Return to privilege mode
4	show mls qos queuing	Show QoS queue map list

Configuration examples:

Raisecom#**config**

Raisecom(config)# **queue cos-map 1 1-4**

Raisecom(config)#**exit**

Raisecom#**show mls qos queuing**

show results as:

the queue schedule mode: strict priority(SP)

Cos-queue map:

cos-queueid
0 - 1
1 - 1
2 - 1
3 - 1
4 - 1
5 - 3
6 - 4
7 - 4

To renew CoS-queue map list to default map relation, use command **no**.

Steps	Command	Description
1	config	Entry into global configuration mode
2	no queue cos-map	Renew default map relation
3	exit	Return to privilege mode
4	show mls qos queuing	Show QoS queuing map list

To check whether the configuration is correct, use command show:

Raisecom#**show mls qos queueing**

the queue schedule mode: strict priority(SP)

Cos-queue map:

cos-queueid
0 - 1
1 - 1
2 - 2
3 - 2
4 - 3
5 - 3
6 - 4
7 - 4

24.7.6 Set Ports Based on smac, dmac, vlan's Frame Priority and Priority Override Function

Ports can be based on smac, dmac, vlan entering switch's message frame priority and queue priority override.

Configuration steps as below:

Steps	Command	Description
1	config	entry into global configuration mode
2	interface { port-list } <1-MAX_PORT_NUM >	Entry into Ethernet physic interface mode 1-MAX_PORT_NUM equipement port numbers set up ports based onsmac, dmac's frame priority or queue priority override function
3	mls qos {smac dmac} {priority-set cos-override}	Smac: source MAC Dmac: destination MAC cos-override: frame priority priority-set: queuepriority set up ports based onsmac,dmac's frame priority and queue priority override function
4	mls qos {smac/dmac} priority-set cos-override	Smac: source MAC Dmac: destination MAC cos-override: frame priority priority-set: queue priority set up ports based onvlan's frame priority or queue priority override function
5	mls qos vlan {priority-set cos-override}	cos-override: frame priority priority-set: queue priority set up ports based on vlan's frame priority and queue priority override function
6	mls qos vlan priority-set cos-override	cos-override: frame priority priority-set: queue priority
7	exit	Exit

8 **show mls qos port-list** {1-MAX_PORT_NUM }
Display QoS configuration information
1-MAX_PORT_NUM equipement port numbers

To use command no Renew all priority override based on smac、dmac、vlan to default configuration(when both of them are not override).

24.7.7 Monitoring and Maintenance

Command	Description
show mls qos maps [cos-dscp ip-prec-dscp dscp-cos dscp-mutation]	Display all map list's configuration content。 cos-dscp: COS to DSCP map ip-prec-dscp: Ip priority to DSCP map dscp-cos: DSCP to CoS map dscp-mutation: DSCP mutation map
show mls qos queuing	Display QoS queue map list

show mls qos port-list {1-
MAX_PORT_NUM }

Display QoS configuration information
1-MAX_PORT_NUM: equipment port numbers

1. Map list information maps

Raisecom#**show mls qos maps**

Dscp-cos map:

```
d1 : d2  0  1  2  3  4  5  6  7  8  9
-----
0:      0  0  0  0  0  0  0  0  1  1
1:      1  1  1  1  1  1  2  2  2  2
2:      2  2  2  2  3  3  3  3  3  3

2:     20 21 22 23 24 25 26 27 28 29
3:     30 31 32 33 34 35 36 37 38 39
4:     40 41 42 43 44 45 46 47 48 49
5:     50 51 52 53 54 55 56 57 58 59
6:     60 61 62 63
```

Dscp-dscp mutation map:

aaa:

d1 : d2 0 1 2 3 4 5 6 7 8 9

0: 0 1 2 3 4 5 6 7 8 9
1: 30 30 30 30 30 30 30 30 30 30
2: 30 21 22 23 24 25 26 27 28 29
3: 30 31 32 33 34 35 36 37 38 39
4: 40 41 42 43 44 45 46 47 48 49
5: 50 51 52 53 54 55 56 57 58 59
6: 60 61 62 63

2. Queue map list information queueing

Raisecom#show mls qos queueing

the queue schedule mode: bounded delay

wrr queue weights:

queueid-weights-delay

1 - 1 - 100
2 - 3 - 100
3 - 5 - 100
4 - 7 - 100

Cos-queue map:

cos-queueid

0 - 1
1 - 1
2 - 2
3 - 2
4 - 3
5 - 3
6 - 4
7 - 4

3. display QoS configuration information:

Raisecom#show mls qos port-list 2

<i>port</i>	<i>smac-policy</i>	<i>dmac-policy</i>	<i>vlan-policy</i>
2	<i>priority-set</i>	--	--

24.7.8 Specific Configuration Examples

See the sections for details.

24.8 Queue and Adjust Function Mode

So far, the equipments support four queue adjust modes: strict priority (SP), weighted priority (WRR), BOUND-DELAY mode and SP+WRR's mixed mode. Default set is priority mode.

24.8.1 Queue and Adjust Default Configuration

Function	Default value
Queue adjust policy	Strict priority adjust SP

24.8.2 SP Configuration

Configuration steps as:

Steps	Command	Description
1	config	entry into global configuration mode
2	queue strict-priority	Configuration is strict priority
3	exit	Return to privilege mode
4	show mls qos queuing	display QoS queuing information

24.8.3 WRR Configuration

Configuration steps as:

Steps	Command	Description
1	config	entry into global configuration mode
2	queue wrr-weight <i>weight0 weight1 weight2 weight3</i>	Set ports' adjust mode as WRRmode Weight 0-3: set queue 0-3 weight value
3	exit	Return to privilege mode
4	show mls qos queuing	display QoS queuing information

24.8.4 SP+WRR Configuration

Configuration steps as:

Steps	Command	Description
1	config	entry into global configuration mode

2	queue preempt-wrr <i>weight1 weight2 weight3</i>	Set port adjust mode as PREEMP-WRR mode, like queue1 is strict priority, rest queues follow the weights Weight 1-3: set queue1-3 weight value
3	queue preempt-wrr <i>weight0 weight1</i>	Set ports adjust mode as PREEMP-WRR mode, like queue 0, 1 are strict priority, rest queue follow the weights
4	exit	Return to privilege mode
5	show mls qos queuing	display QoS queuing information

24.8.5 Monitoring and Maintenance

Command	Description
show mls qos queuing	Display QoS's queuemap list

- Queue map list information queuing

Raisecom#**show mls qos queuing**

the queue schedule mode: bounded delay

wrr queue weights:

queueid-weights-delay

1 - 1 - 100

2 - 3 - 100

3 - 5 - 100

4 - 7 - 100

Cos-queue map:

cos-queueid

0 - 1

1 - 1

2 - 2

24.8.6 Specific Configuration Examples

Configuration examples: set queue as WRR mode, weight as 1:2:4:8:

Raisecom#**config**

```
Raisecom(config)# queue wrr-weight 1 2 4 8
```

```
Raisecom(config)#exit
```

```
Raisecom#show mls qos queuing
```

Display results:

```
Raisecom#show mls qos queuing
```

the queue schedule mode: weighted round robin(WRR)

wrr queue weights:

Queue ID - Weights - Delay

1 - 1 - 0

2 - 2 - 0

3 - 4 - 0

4 - 8 - 0

24.9 QoS Trouble Shoot

- Port TRUST status and policy configuration are mutually exclusive.
- Data flow TRUST status and SET actions are mutually exclusive.
- To delete class-map、 policy-map、 policer, it will be failed if they have been applied for the ports.
- If class-map、 policy-map have been applied for the ports, then modification for match statements and data flow actions (as set action) will fail.
- Before apply data flow policy, QoS must be started first; data flow policy will be failed if QoS is stopped.
- If class-map match type is matcha-all, the configuration may fail because there might be conflicts between matching information.
- To match a ACL, ACL must be defined first and its type must be permit.
- To match a class-map, sub class-map must be type of match-all.
- As configuration data flow become more, it may be failed in applying because it is getting the capacity biggest rule. (8 ports have 256 rules)
- To start QoS policy, it is suggested to turn off data flow control function;

24.10 QoS Command Reference

Command	Description
[no] mls qos	Run and Stop QoS
[no] mls qos trust [cos dscp ip-precedence]	Set ports TRUST status
mls qos default-cos default-cos	Set QoS ports Default CoS value
no mls qos default-cos	Renew QoS ports Default CoS value
mls qos map dscp-mutation dscp-name dcp-list to dscp	Create DSCP-mutaion map list
no mls qos map dscp-mutation dscp-name	Delete DSCP-mutaion map list
[no] mls qos dscp-mutation dscp-name	Apply or decline DSCP-mutaion map application
class-map class-map-name [match-any match-all]	Create class-map

no class-map <i>class-map-name</i>	Delete class-map
[no] policy-map <i>policy-map-name</i>	Create delete policy map
description <i>WORD</i>	Set policy map and class-map description information
[no] class <i>class-map-name</i>	apply class map on policy
match { ip-access-list <i>acl-index</i> mac-access-list <i>acl-index</i> access-list-map <i>acl-index</i> ip dscp <i>dscp-list</i> ip precedence <i>ip-precedence-list</i> class <i>calss-name</i> vlan <i>vlanlist</i> }	Set match statements
no match { ip-access-list <i>acl-index</i> mac-access-list <i>acl-index</i> access-list-map <i>acl-index</i> ip dscp ip precedence class <i>calss-name</i> vlan <i>vlanlist</i> }	Delete match statements
[no] trust [cos dscp]	Set data flow TRUST status
set { ip dscp <i>new-dscp</i> ip precedence <i>new-precedence</i> cos <i>new-cos</i> }	Set actions
no set { ip dscp ip precedence cos }	Delete set value
mls qos { aggregate-policer class-policer single-policer } <i>policer-name rate burst</i> [exceed-action { drop policed-dscp-transmit <i>dscp</i> }]	Create policer
no mls qos { aggregate-policer class-policer single-policer } <i>policer-name</i>	Delete policer
[no] police <i>policer-name</i>	Apply policer
service-policy <i>policy-map-name</i> ingress <i>portid</i> [egress <i>portlist</i>]	Apply policy
no service-policy <i>policy-map-name</i> ingress <i>portid</i>	Decline apply policy
mls qos map cos-dscp <i>dscp1 dscp2 dscp3 dscp4 dscp5 dscp6 dscp7 dscp8</i>	configurationCoS to DSCP map
no mls qos map cos-dscp	Renew CoS to DSCP map
mls qos map ip-prec-dscp <i>dscp1 dscp2 dscp3 dscp4 dscp5 dscp6 dscp7 dscp8</i>	Configuration ToS to DSCP map
no mls qos map ip-prec-dscp	Renew ToS to DSCP map
mls qos map dscp-cos <i>dscp-list to cos</i>	Configuration DSCP to switch internal priority map
no mls qos map dscp-cos	Renew DSCP to switch internal priority map
queue cos-map <i>queue-id cos-list</i>	Configuration switch internal priority to queue map
no queue cos-map	Renew switch internal priority to queue map
queue wrr-weight <i>weight0 weight1 weight2 weight3</i>	Configuration switch queue adjust mode as WRR
queue bounded-delay <i>weight0 weight1 weight2 weight3 delaytime</i>	Set port adjust mode as BOUNDDelay mode
queue preemp-wrr <i>weight1 weight2 weight3</i>	Set port adjust mode as PREEMP-WRR mode

queue strict-priority	Set port adjust mode as strict priority mode
show mls qos	Display QoS on/off status
show mls qos policer [<i>policename</i> <i>aggregate-policer</i> / <i>class-policer</i> / <i>single-policer</i>]	Display policer information
show mls qos maps [<i>cos-dscp</i> / <i>dscp-cos</i> / <i>dscp-mutation</i> / <i>ip-prec-dscp</i>]	Display every map list configuration content
show mls qos queueing	Display in/out queue configuration information
show mls qos port <i>portid</i> [policers]	Display port strategy configuration, policer,etc information
show class-map [<i>class-map-name</i>]	Display class-map information
show policy-map [<i>policy-map-name</i> [port <i>portid</i>] [class <i>class-name</i>]	Display policy information

Chapter 25 802.3ah OAM

25.1 802.3ah OAM Principle Introduction

IEEE802.3ah OAM (Operation Administration Maintenance) is used to provide more efficient Ethernet link operation, management and maintenance. As the efficient complementarity of the high managing tool, OAM enhances the Ethernet management and monitoring.

25.1.1 OAM mode

The process of Ethernet OAM connecting is also called Discovery, which is the process of one OAM entity discovers another one in the remote device for creating a stable conversation.

In the process, the connected Ethernet OAM (OAM Function port) entity sends the Ethernet configuration information and local node support Ethernet OAM ability information by switching the information OAM PDU to the opposite in two way. Once OAM receives the configuration data from the opposite, it will decide whether build the OAM connection up. If both ends are agreed to build up the OAM connections, Ethernet OAM protocol will start to run on the LAN Layer.

There are two modes for building up Ethernet OAM connection: active mode and passive mode. The connection can only be active by OAM entity and passive OAM entity has to wait for the connecting request from the opposite OAM entity.

After the Ethernet OAM is connected, OAM entities from both ends send information OAMPDU to keep the connection. If the Information OAMPDU is not received by the OAM entity from opposite in 5 seconds, it will be considered as connection time-out. Thus OAMs are needed to reconnect.

Information OAMPDU packet is sent by internal counter control with maximum rate of 10 packets/second.

25.1.2 OAM loop-back

OAM loop-back can only be achieved after Ethernet OAM connection is built up。 In connected situation, active mode OAM will send OAM loop-back command and opposite will response for that command. As remote is in loop-back mode, all packets but OAMPDU packet will be sent back in the original route.

Periodical loop-back detection can detect network failure on time and find out the failure happened location by subsection loop-back detection. It can help users to remove failure.

25.1.3 OAM events

It is difficult to detect the Ethernet failure, especially when the physical network communicational is in no-breakdown but low network. OAMPDU states a Flag Domain which allows Ethernet OAM entity sends the failure information to the opposite. That Flag also states the threshold events as shown below:

Link Fault: Signal lost in the opposite link.

Dying Gasp: Unpredict states happen, as power cut-down.

Critical Event: Uncertain critical events happen.

Ethernet OAM connecting process is continually sending the Information OAMPDU. Local OAM entity can send the local threshold event information to opposite OAM entity through Information OAMPDU. The Administrators can always notice the link status and solve the related problems on time.

Ethernet OAM monitors the link by Event Notification OAMPDU switches. Once the link fails, the local link will monitor the failure. And it will send monitors the Event Notification OAMPDU to opposite Ethernet OAM entity to inform the threshold events. Administrator can notice the network status by monitoring the link.

- Error frame event: error frame number in unit time is over stated threshold number.
- Error frame period event: states frame number N as a period; it means in the period of received N error frames, the error fane number is over stated threshold one.
- Error frame second event: indicated in M seconds, the error frame's time in seconds are over the stated threshold number.(error frame second states: an error frame happens in a specific second and this second is called error frame second.)

25.1.4 OAM mib

Devices can gain opposite device link configuration/ statistics value through OAM and then get link status/ data.

25.2 802.3ah OAM Mode Configuration

OAM supports two modes: active mode and passive mode. Active mode starts OAM opposite discover process, supports functions but non-response remote loop-back command and variable gained requests; passive mode does not start OAM opposite discover process, does not send remote loop- back command and variable gained request. Different devices use different mode supports and default configurations. If the device supports passive mode, then its default mode will be passive mode or it will be active mode. If the device only supports one mode, then it does not support mode configuration. OAM mode. OAM mode is all OAM port link share, and users can set mode configuration on the devices which support both two mode as shown below:

Steps	Command	Description
1	config	Entry global configuration mode
2	oam { <i>active</i> / <i>passive</i> }	Set OAM as active/passive mode
3	Exit	Return to privilege use mode
4	show oam	Show OAM loop-back information

Set device OAM as active mode:

```
Raisecom#config
```

```
Raisecom(config)#oam active
```

```
Raisecom(config)#exit
```

```
Raisecom#show oam
```

25.3 802.3ah OAM Active Mode Function

25.3.1 OAM default configuration

Function	Default Value
OAM Enable\Disable	Enable
Opposite OAM event alarm	Disable

25.3.2 OAM enable/disable configuration function

✧ OAM Enable\Disable

OAM is Ethernet point to point link protocol. Enable/Disable is used for all the link ports. In default situation, all ports OAM are Enable, user can Enable/ Disable OAM by the following steps:

Steps	Command	Description
1	Config	Entry global configuration mode
2	interface port <i>port_number</i>	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number
3	oam { <i>disable</i> / <i>enable</i> }	Enable or Disable OAM
4	Exit	Return Global Configuration mode
5	Exit	Return privileged EXEC mode
6	show oam	Show OAM Configuration state

Disable port 2 OAM:

```
Raisecom#config
```

```
Raisecom(config)#interface port 2
```

```
Raisecom(config-port)#oam disable
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

✧ Show OAM local link status

Privilege mode command: show oam can display OAM link local configuration and status include mode configuration, management status, working status, maximum packet length, configuration version and function support , etc. Through this command, users can understand OAM link configuration, running status, etc.

```
Raisecom#show oam
```

Port: 1

Mode: Passive

Administrative state: Enable

Operation state: Disabled

Max OAMPDU size: 1518

Config revision: 0

Supported functions: Loopback, Event, Variable

Port: 2

Mode: Passive

Administrative state: Disable

Operation state: Disable

Max OAMPDU size: 1518

Config revision: 0

Supported functions: Loopback, Event, Variable

✧ Show OAM opposite link status

Privilege mode command: show oam peer can display the opposite device information on OAM link, include: opposite MAC address, manufactory OUI, manufactory information, mode configuration, maximum packet length, configuration version and function support information. If OAM link is not connected, then there no information will be displayed.

Raisecom#show oam peer

Port: 1

Peer MAC address: 000E.5E00.91DF

Peer vendor OUI: 000E5E

Peer vendor info: 1

Peer mode: Active

Peer max OAMPDU size: 1518

Peer config revision: 0

Peer supported functions: Loopback, Event

25.3.3 Run OAM loop-back function

OAM provide link layer remote loop-back system, which can be used for located link error position, performance and quality test. Under link loop-back status, devices will loop-back all link received packets to the opposite devices except OAM packet. Local device uses OAM remote command to enable or disable remote loop-back. Opposite device will use loop-back configuration command to control whether response loop-back command.

In central office end , users can build up remote loop-back through remote loop-back command.

Steps	Command	Description
-------	---------	-------------

1	config	Entry global configuration mode
2	interface port <i>port_number</i>	Entry Ethernet physical interface mode, <i>port_number</i> is physical interface number
3	oam remote-loopback	Build up remote loop-back
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show oam loopback	Show OAM loop-back situation

Build remote loop-back on port link 2:

Raisecom#**config**

Raisecom(config)#**interface port 2**

Raisecom(config-port)#**oam remote-loopback**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show oam loopback**

Users can remove remote loop-back as below:

Steps	Command	Description
1	Config	Entry global configuration mode
2	interface port <i>port_number</i>	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number
3	no oam remote-loopback	Remove remote loop-back
4	Exit	Return global configuration mode
5	Exit	Return privileged EXEC mode
6	show oam loopback	Show OAM loop-back state

Remote loop-back on remove end link 2:

Raisecom#**config**

Raisecom(config)#**interface port 2**

Raisecom(config-port)#**no oam remote-loopback**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show oam loopback**

Note: Remote loop-back only can be achieved after Ethernet OAM is connected.

25.3.4 Opposite OAM event alarm function

By default, when opposite link monitor event is received, device will not inform network managing center through SNMP TRAP. Users can use Enable/Disable opposite monitor events is informed to the network managing center.

Steps	Command	Description
1	config	Entry global configuration mode
2	interface port <i>port_number</i>	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number
3	oam peer event trap <i>{disable enable}</i>	Enable or Disable opposite OAM monitor event is informed network managing center
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show oam trap	show OAM TRAP information

Enable port 2 opposite link monitoring event informed to network managing center:

```
Raisecom#config
```

```
Raisecom(config)#interface port 2
```

```
Raisecom(config-port)# oam peer event trap enable
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show oam trap
```

25.3.5 View opposite IEEE 802.3 Clause 30 mib

OAM variable gain is a link monitoring measure. It allows local device to get opposite device current variable value thus get current link status. IEEE802.3 Clause30 particularly states the variables which support OAM gain and their representing way. Variable can be divided into its biggest unit -- object which include package and attribute. Package also is combined by several attribute. Attribute is variable's smallest unit. OAM variable gain uses Clause 30 to state object/package/attribute's branch described requesting objects. And branches plus the variable value are used to represent object response variable request. Now, all devices have supported both OAM information and port statistics as object variable gain. EPON OLT device also supports MPCP and OMPEmulation object information gain.

When device OAM work as active mode, users can gain opposite devices OAM information or port statistics variable values as the steps below:

Steps	Command	Description
1	show oam peer <i>{link-statistics oam-info}</i> <i>{port-list client line}</i> <i>port_number</i>	Gain opposite device OAM information or port statistics variable value <i>port_number</i> is physical interface number

Gain port 2 opposite device OAM information value is shown as below:

Raisecom(debug)#**show oam peer oam-info port-list 2**

Note: OAM variable gain is only achieved if and only if Ethernet OAM connection is built up.

25.3.6 OAM statistics clear function

OAM calculates the number of all different types of OAM packets which are sent/received on each OAM port link. The types of packets are: information, link event information, loop-back control, variable gain request, variable gain response, organise using, uncertain type and repeated event information. Users can clear port link OAM statistics information as follow steps:

Steps	Command	Description
1	config	Entry global configuration mode
2	interface port <i>port_number</i>	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number
3	clear oam statistics	Clear OAM port link statistics information
4	exit	Entry global configuration mode
5	exit	Return to privileged EXEC mode
6	show oam statistics	show OAM link statistics information

Clear port 2 OAM link statistics information as below:

```
Raisecom#config
```

```
Raisecom(config)#interface port 2
```

```
Raisecom(config-port)#oam clear statistics
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show oam statistics
```

25.3.7 Monitoring and maintenance

Command	Description
show oam	show OAM link's local configuration and status
show oam peer	show OAM link's opposite device information
show oam loopback	Show remote loop-back information
show oam peer event	show opposite device informed event
show oam trap	Show OAM related SNMP TRAP information and its configuration situation.

show oam statistics

show all OAM port link statistics information

25.3.8 Configuration example

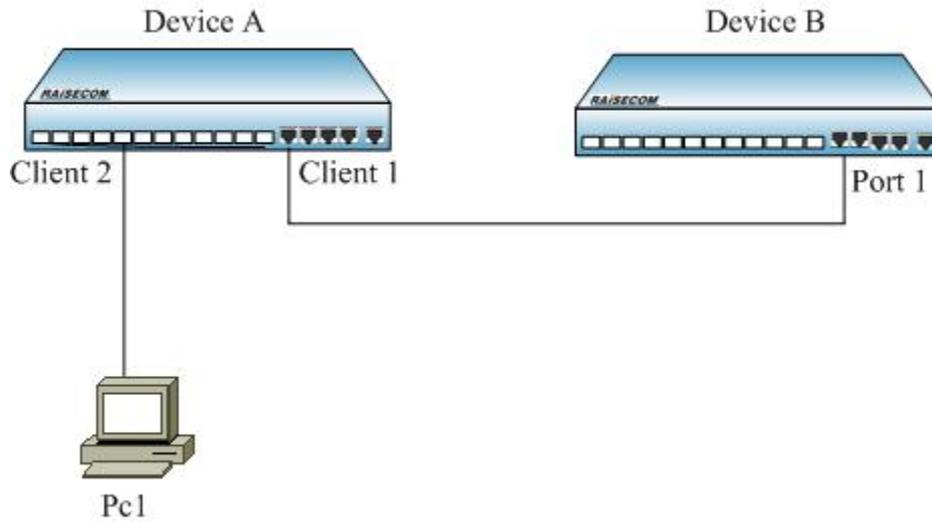

Figure 1-1

As figure 1-1, to set remote loop-back as following configuration:

```
Raisecom#config
```

```
Raisecom (config)#interface port 1
```

```
Raisecom(config-port)#oam enable
```

```
Raisecom(config-port)#exit
```

```
Raisecom#show oam port-list 1
```

```
Port: 1
```

```
Mode: Active
```

```
Administrate state: Enable
```

```
Operation state: Operational
```

```
Max OAMPDU size: 1518
```

```
Config revision: 0
```

```
Supported functions: Loopback, Event
```

```
Raisecom#config
```

```
Raisecom (config)#interface port 1
```

```
Raisecom(config-port)#oam remote-loopback
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show oam loopback
```

```
Port: 1
```

```
Loopback status: Remote
```

25.4 802.3ah OAM Passive Function

25.4.1 OAM default configuration

Function	Default Value
Oam Enable\Disable	Enable
Oam mode	Passive
Response\Ignore opposite oam loop-back Configuration	Response
Local oam event alarm	Disable
Oam failure indication	Enable
Error frame periodical event window and threshold.	window 10 (s) Threshold 1 (unit)
Error frame event window and threshold	Window 10 (s) Threshold 1 (unit)
Error frame second statistics event window and threshold	Window 600 (s) Threshold 1 (unit)

25.4.2 OAM enable/disable configuration

➤ OAM Enable\Disable

OAM is Ethernet point to point link protocol, Enable/Disable is for different link port. In default situation, all ports OAM are Enable. Users can enable/disable OAM by following steps:

Steps	Command	Description
1	Config	Entry global configuration mode
2	interface { line client } port_number	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number
3	oam { disable enable }	Enable or Disable OAM
4	Exit	Return to global configuration mode
5	Exit	Return to privileged EXEC mode
6	show oam	show OAM configuration situation

Disable port 2 OAM as follow:

Raisecom#**config**

Raisecom(config)#**interface port 2**

Raisecom(config-port)#**oam disable**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

➤ Show OAM local link status

Privileged EXEC mode command: show oam can show OAM link local configuration and status, displayed information include mode configuration, managing status, running status, maximum packet length, configuration version and function support information. By this command, users can understand OAM link configuration, running status such information.

Raisecom#**show oam**

Port: 1

Mode: Passive

Administrative state: Enable

Operation state: Disabled

Max OAMPDU size: 1518

Config revision: 0

Supported functions: Loopback, Event, Variable

Port: 2

Mode: Passive

Administrative state: Disable

Operation state: Disable

Max OAMPDU size: 1518

Config revision: 0

Supported functions: Loopback, Event, Variable

➤ Show OAM opposite link status

Privileged EXEC mode command: show oam peer can show OAM link's opposite device information, include opposite MAC address, manufactory OUI, manufactory information, mode configuration, maximum packet length, configuration version and function support information. If OAM link is not built up, then it will not show any information.

Raisecom#**show oam peer**

Port: 1

Peer MAC address: 000E.5E00.91DF

Peer vendor OUI: 000E5E

Peer vendor info: 1

Peer mode: Active

Peer max OAMPDU size: 1518

Peer config revision: 0

Peer supported functions: Loopback, Event

25.4.3 Response/ignore opposite OAM loop-back configuration function

OAM provide link layer remote loop-back system, can be used for locating link error position, function and quality testing. In link loop-back status, all packets received from the link but OAM packet loop-back to opposite device. Local device use OAM remote loop-back command enable or disable remote loop-back, opposite device uses loop-back configuration command control to response loop-back command.

In default situation, device loop-back responses as Enable, users set loop-back response configuration as below:

Steps	Command	Description
1	config	Entry global configuration mode
2	interface { line client } port_number	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number
3	oam loopback { ignore process }	Enable or Disable OAM loop-back response
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show oam loopback	show OAM loop-back situation

Disable response port link 2 OAM remote loop-back:

```
Raisecom#config
```

```
Raisecom(config)#interface port 2
```

```
Raisecom(config-port)#oam loopback ignore
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show oam loopback
```

25.4.4 OAM link monitor configuration function

OAM link monitor is used to detect and report different link errors. When link errors are detected, device informs opposite error cause time, window and threshold configuration by OAM event information packets. Opposite reports events to network managing center by SNMP TRAP. Local device reports events directly to network managing center by SNMP TRAP. OAM link monitoring supports events below:

Error frame events: indicates periodical error frames over threshold. When indicated time periodically error frames over threshold, device will have that event.

Error frame periodical event: lately N frames' error are over threshold, N is indicated value; once lately N frames' error over threshold is detected, device will release that event.

Error frame second statistics event: lately M seconds, the error frames' second number over threshold. M is the indicated value. When error frame second number is over indicated threshold in M seconds, device releases that event.

OAM named the previous monitoring period, frame calculate number and second statistics number as

monitoring window.

Users can set the link monitoring configuration as steps below:

Steps	Command	Description
1	config	Entry global configuration mode
2	interface { line client } port_number	Enter Ethernet physical interface mode <i>port_number</i> is physical interface number
3	oam errored-frame window <1-60> threshold <0-65535>	Config error frame monitoring window and threshold <1-60> is monitoring window, unit is second, <0-65535> is threshold.
4	oam errored-frame-period window <100-60000> threshold <0-65535>	Config error frame periodical event monitoring window and threshold <100-60000> is monitoring window, unit is second, <0-65535> is threshold.
5	oam errored-frame-seconds window <10-900> threshold <0-900>	Config error frame statistics monitoring window and threshold <10-900> is monitoring window, unit is second, <0-900> is threshold.
6	exit	Return to global configuration mode
7	exit	Return to privileged EXEC mode
8	show oam notify	show OAM events configuration situation

Configuration port 2 error frame event monitoring window is 2 seconds, threshold is 8 error frame: error frame period event monitoring window is 100 ms, threshold is 128 error frames; error frame second statistics event monitoring window is 100 seconds, threshold is 8 seconds.

Raisecom#**config**

Raisecom(config)#**interface port 2**

Raisecom(config-port)# **oam errored-frame window 2 threshold 8**

Raisecom(config-port)# **oam errored-frame-period window 100 threshold 128**

Raisecom(config-port)# **oam errored-frame-second window 100 threshold 8**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show oam notify**

Using physical layer interface configuration command **no oam errored-frame** can resume error frame event monitoring window and threshold as Default Value

Using physical layer interface configuration command **no oam errored-frame-period** can resume error frame event monitoring window and threshold as Default Value

Using physical layer interface configuration command **no oam errored-frame-second** can resume error frame event monitoring window and threshold as Default Value.

25.4.5 OAM fault indication function

OAM fault indication function is used to inform opposite device local device with abnormal event as link-fault, power break, abnormal temperature, etc. Those will cause the faults as link disable, device restart, ect. Now stated faults are link-fault, dying-gasp and critical-event caused by abnormal temperature. In default, device fault indicated as Enable status, thus when fault happened, device informs opposite by OAM. Users can Enable or Disable faults (except link-fault fault indicated must inform opposite) by following steps:

Steps	Command	Description
1	config	Entry global configuration mode
2	interface { line client } <i>port_number</i>	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number
3	oam notify { <i>dying-gasp</i> / <i>critical-event</i> } { <i>disable</i> <i>enabl</i> }	Enable or Disable OAM error indicated opposite
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show oam notify	show OAM event configuration situation

Disable port 3 critical-event fault indication:

```
Raisecom#config
```

```
Raisecom(config)#interface port 3
```

```
Raisecom(config-port)# oam notify critical-event disable
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show oam notify
```

25.4.6 Local OAM event alarm function

In Default, when link monitoring event is detected, device will not inform network managing center by SNMP TRAP. Users can use Enable or Disable to inform network managing center the monitor events by following steps:

Steps	Command	Description
1	config	Entry global configuration mode
2	interface { line client } <i>port_number</i>	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number
3	oam event trap { <i>disable</i> / <i>enable</i> }	Enable or Disable OAM monitoring event to inform network managing center
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode

6	show oam trap	show OAM TRAP information
---	----------------------	---------------------------

Enable port 2 link monitoring event inform to network managing center:

Raisecom#**config**

Raisecom(config)#**interface port 2**

Raisecom(config-port)# **oam event trap enable**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show oam trap**

25.4.7 IEEE 802.3 Clause 30 mib support

OAM variable gain is a link monitoring measure. It allows local device to gain opposite device lately variable value. Thus it can gain lately link status. IEEE802.3 Clause30 detailly states support OAM gain variable and its representation. Object is the biggest division of variable. Each object has package and attribute. Package is include many attribute. Thus attributes are the smallest variable unit. OAM variable gain states object/package/attribute branches description as request objects, and branches plus variable value are used to represent as object response variable request. Now, all devices can support OAM information and port statistics variable gain. EPON OLT device also supports MPCP and OMPEmulation object information gain.

When device OAM is in active mode, users can gain opposite device OAM information or port statistics variable value by following steps:

Steps	Command	Description
1	show oam peer {link-statistics oam-info} { client line } <i>port_number</i>	Gain opposite device OAM information or port statistics variable value <i>port_number</i> is physical interface number

Gain port 2 opposite device OAM information value:

Raisecom(debug)#**show oam peer oam-info port-list 2**

25.4.8 OAM statistics clear function

OAM statistics sending/receiveing all OAM packets number on each OAM port link. Packets types:information, link events information, loop-back control, variable gain request, variable gain response, organise using, uncertain type and repeat event inforamtion. Users can clear port link OAM statistics information as following steps:

Steps	Command	Description
1	config	Entry global configuration mode
2	interface { line client } <i>port_number</i>	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number

3	clear oam statistics	Clear OAM port link statistics information
4	exit	Return to global Configuration mode
5	exit	Return to privileged EXEC mode
6	show oam statistics	show OAM link statistics information

Clear port 2 OAM link statistics information

Raisecom#**config**

Raisecom(config)#**interface port 2**

Raisecom(config-port)#**oam clear statistics**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show oam statistics**

OAM record recent happening local and opposite link monitoring and fault (key) events. Users can clear port link OAM local and opposite events record as following steps:

Steps	Command	Description
1	config	Entry global configuration mode
2	interface { line client } port_number	Entry Ethernet physical interface mode <i>port_number</i> is physical interface number
3	clear oam event	Clear OAM port link event record
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show oam event	show OAM link local event record
7	Show oam peer event	show OAM link opposite event record

Clear port 2 OAM link events record:

Raisecom#**config**

Raisecom(config)#**interface port 2**

Raisecom(config-port)# **clear oam event**

Raisecom(config-port)#**exit**

Raisecom(config)#**exit**

Raisecom#**show oam event**

Raisecom#**show oam peer event**

25.4.9 Monitoring and maintenance

Command	Description
show oam	show OAM link local configuration and status
show oam peer	show OAM link information on opposite device
show oam loopback	show remote loop-back information
show oam event	show local device happening events
show oam peer event	show opposite device informing events
show oam notify	show all OAM link local events informing configuration
show oam statistics	show all OAM port link statistics information

25.4.10 Configuration example

According to Figure 1-1, if response remote loop-back, device A can be configured as below:

```
Raisecom#config
```

```
Raisecom(config)#oam passive
```

```
Raisecom (config)#interface client 1
```

```
Raisecom(config-port)#oam enable
```

```
Raisecom (config-port)# oam loopback process
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show oam loopback
```

```
Port: client1
```

```
Loopback status: No
```

```
Loopback react: Process
```

26.1 Extended OAM principle overview

Extended OAM, using IEEE802.3ah OAM to manage and monitor the remote device. It is composed by 3 parts:

1. Get the attribute of remote device;
2. Upload and down file of remote device;
3. Manage extended OAM link state and statistic.

Extended OAM includes the followings:

- Get remote attribute: the extended OAM attribute can be used to get the remote attribute form the center site.
- Set remote device: config the remote device, including host name, enable and disable port, duplex, bandwidth, fault transfer etc.
- Set remote device network management parameter: can config remote device network management parameter, such as ip address, gateway, community parameter and management VLAN etc, then implement full management with SNMP protocol.
- Remote TRAP: when the port of remote device show LINK UP/DOWN, the remote device will send extended OAM notification fram to inform the center site, then the center device will send TRAP.
- Extended remote loopback: the remote optical port can be set loopback function, the function of whether to count repeatedly can be set.
- Reset remote device: send command to reset remote device.
- Other remote device function management: with the increasing of remote device, center device can manage more remote device with extended OAM function such as: SFP、Q-in-Q、Virtual Circuit diagnosis etc.
- Download remote file: the remote can get remote file from FTP/TFTP server. The file also can be send from the server to center device, then the remote device can get from the center device.
- Upload remote file: put the file to FTP/TFTP server, or from the remote device to center one, then put to server from the center device.
- Link statistic and management of extended OAM function.

Note: extended OAM link can only be established between center and remote site. The devices of two end must be set to master and passive, or the link can't be up.

26.2 Extended OAM management

26.2.1 Default extended OAM configuration

Function	Default configuration
Powered configuration request	Enable
Extended OAM notice	Enable
Remote end trap switch	open

26.2.2 Extended OAM configuration mode

To configure remote equipments on a local end equipment, you need to enter remote configuration mode. The steps to enter remote configuration mode are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>portid</i> : physical port ID
3	remote-device	Enter remote configuration mode

To configure remote equipment ports on local equipment, you need to enter remote interface configuration mode. The steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	interface client <i>client-id</i>	Enter remote physical port configuration mode <i>Clinet-id</i> port ID

26.2.3 Remote equipment system configuration

Configure remote equipment system configuration, including configuring remote equipments' hostname, the maximum frame length, save and delete the configuration files.

The steps to configure remote equipment hostname and remote equipment maximum frame length are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	hostname <i>HOSTNAME</i>	Configure remote equipment hostname <i>HOSTNAME</i> remote system network name
5	system mtu <1500-8000>	Configure remote equipment maximum frame length
6	show remote-device information	Show current remote equipment hostname and actual effective maximum frame length

Note: configure the maximum frame length of remote equipment; the actual effective value may be

different because of different remote equipment. For example, RC552-GE can configure remote maximum frame length to 1916 bytes or 1536 bytes. If the remote end is RC552-GE, and the configuration value is less than 1916, the effective value is 1536, or it is 1916.

The steps to save remote equipment configuration file is as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>portid</i> : physical port number
3	remote-device	Enter remote configuration mode
4	write	Save remote equipment configuration file

The steps to delete remote equipment configuration file is as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>portid</i> : physical port number
3	remote-device	Enter remote configuration mode
4	erase	Delete remote equipment configuration file

When executing the command to delete remote equipment configuration file, you need to confirm your operation.

Note:

- The operation to the configuration file is to save and delete the file on remote equipment, not to operate the local equipments file system.
- It takes a long time save and delete remote files, so when executing the command, there may be some unusual situations like OAM link breaking down.

26.2.4 Configure extended OAM protocol

The steps to enable/disable powered configuration request configuration are as follows:

Step	Command	Description
1	config	Enter global configuration
2	extended-oam config-request <i>enable</i> extended-oam	Enable/disable powered configuration request <i>enable</i> : enable powered configuration request

	config-request <i>disable</i>	<i>disable</i> : disable powered configuration request
3	exit	Return to privileged EXEC mode
4	show extended-oam status	Show extended OAM link state

The steps to disable/enable sending extended OAM notices configuration are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	extended-oam notification <i>enable</i>	Enable/disable sending extended OAM notice <i>enable</i> : enable sending extended OAM notice
	extended-oam notification <i>disable</i>	<i>disable</i> : disable sending extended OAM notice
3	exit	Return to privileged EXEC mode
4	show extended-oam notification	Show OAM informing frame enable configuration state

26.2.5 Configure remote equipment port

- Configure remote equipment port enable/disable

The steps to disable remote equipment ports are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>portid</i> : port physical ID
3	remote-device	Enter remote configuration mode
4	interface client <i>client-id</i>	Enter remote physical port configuration mode <i>client-id</i> :port ID
5	shutdown	Shutdown remote equipment port

In remote port configuration mode, use **no shutdown** to enable remote equipment port.

- Configure remote equipment port rate/duplex

The steps to configure remote equipment ports rate/duplex are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode

3	remote-device	Enter remote configuration mode
4	interface client <i>client-id</i>	Enter remote physical port configuration mode
5	speed { <i>auto</i> <i>10</i> <i>100</i> <i>1000</i> } duplex { <i>full</i> <i>half</i> }	Configure port rate and duplex mode

When the equipment has 1000M optical port, we can configure optical port auto-negotiation function, the steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	line-speed auto	Configure remote equipment optical port auto-negotiation

In remote configuration mode, use **no line-speed auto** to shutdown optical port auto-negotiation function.

Note: when remote equipment is configured port rate/duplex, there may be some unusual situations like OAM link breaking down.

- Configure remote equipment port stream control/speed control

The steps to enable/disable remote equipment stream control are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	interface client <i>client-id</i>	Enter remote physical port configuration mode
5	flowcontrol { <i>on/off</i> }	Enable/disable remote equipment port stream control function

The steps to configure remote equipment port in/out direction bandwidth are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>Portid</i> physical port ID

3	remote-device	Enter remote configuration mode
4	rate-limit line <i>line-id ingress rate</i> rate-limit client <i>client-id ingress rate</i>	Configure remote equipment port in direction bandwidth <i>Line-id</i> line port ID <i>Client-id</i> client port ID <i>Rate</i> bandwidth
5	rate-limit line <i>line-id egress rate</i> rate-limit client <i>client-id ingress rate</i>	Configure remote equipment port out direction bandwidth

Run **no rate-limit line** *line-id ingress* or **no rate-limit client** *client-id ingress* to restore in remote configuration mode.

Run **no rate-limit line** *line-id egress* or **no rate-limit client** *client-id egress* to restore in remote configuration mode.

- Configure remote equipment port description

The steps to configure remote port information are as follows:

Step	Command	Description
1	config	Enter global configuration
2	interface { port line client } <i>portid</i>	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	description line <i>line-id WORD</i> description client <i>client-id WORD</i>	Configure remote equipment port description information <i>Line-id WORD</i> remote port description information <i>Client-id WORD</i> remote port description information

In remote configuration mode, use **no description line** *line-id* or **description client** *client-id WORD* to delete the description information.

In remote configuration mode, use **show interface port** and **show interface port detail** to show remote port configuration information.

- Start/shutdown extended remote loopback

Starting loopback function may affect data transmission.

Enable remote equipment optical port inside-loopback, you can select the parameter so that the response end could recalculate CRC. The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration ode

2	interface {port line client} portid	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	inside-loopback [crc-recalculate]	Start remote equipment optical port inside-loopback

In remote configuration mode, use **no inside-loopback** to stop remote equipment inside-loopback, use **show inside-loopback** to show remote optical port inside-loopback state and parameter.

- Run remote equipment line diagnoses function

Executing remote equipment line diagnoses function may affect the link and data transmission. The steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	test cable-diagnostics	Run remote equipment line diagnoses

In remote configuration mode, use **show cable-diagnostics** to show remote equipment line diagnoses result.

26.2.6 Upload/download files from remote equipment

- Download the file from server to remote equipment

The system bootroom file, startup file, startup configuration file and FPGA file of remote device can be downloaded from server to remote device (center device as the relay). This function can be started by center device or remote device, and multiple remote devices can be upgraded at the same time.

Center device starts, download from FTP/TFTP server:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	download {bootstrap system-boot startup-config fpga} ftp A.B.C.D USRNAME PASSWORD FILENAME download {bootstrap system-boot startup-config fpga} tftp A.B.C.D FILENAME	Download the file from FTP server to remote equipment <i>A.B.C.D</i> : Server IP address <i>USRNAME</i> : FTP server username <i>PASSWORD</i> : FTP server password <i>FILENAME</i> : The filename on the server

Download the files from TFTP server to remote equipment

A.B.C.D: server IP address

FILENAME: the filename on the server

Acting from the remote equipment, the steps to download files from FTP/TFTP server to remote end are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} <i>portid</i>	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	download {bootstrap system-boot startup-config fpga} ftp <i>A.B.C.D</i> <i>USERNAME</i> <i>PASSWORD</i> <i>FILENAME</i> download {bootstrap system-boot startup-config fpga} tftp <i>A.B.C.D</i> <i>FILENAME</i>	Download the file from FTP server to remote equipment <i>A.B.C.D</i> : Server IP address <i>USERNAME</i> : FTP server username <i>PASSWORD</i> : FTP server password <i>FILENAME</i> : The filename on the server
		Download the files from TFTP server to remote equipment <i>A.B.C.D</i> : server IP address <i>FILENAME</i> : the filename on the server

When the file downloading is over, the remote equipment can be shown with **dir** in privileged EXEC mode, and use **erase** to delete.

➤ Upload files to the server from remote equipment

The system bootroom file and startup configuration file on the remote equipment can be transmitted through local end to do uploading from remote equipment to the server. The function can be started by local equipment or remote equipment. When it is started from local equipment, we can no upgrade several remote equipments at the same time.

Started from local equipment, the steps to upload file from remote equipment to FTP/TFTP server are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} <i>portid</i>	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	upload {startup-config system-boot } ftp <i>A.B.C.D</i> <i>USERNAME</i> <i>PASSWORD</i> <i>FILENAME</i>	Upload file from remote equipment to FTP server <i>A.B.C.D</i> : Server IP address

upload {startup-config system-boot} tftp A.B.C.D FILENAME	<i>USRNAME</i> : FTP server username <i>PASSWORD</i> : FTP server password <i>FILENAME</i> : The filename on the server Upload file from remote equipment to TFTP server <i>A.B.C.D</i> : server IP address <i>FILENAME</i> : the filename on the server
--	---

Started from remote equipment, the steps to upload file from remote equipment to FTP/TFTP server are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter ethernet physical interface mode <i>Portid</i> physical port ID
3	upload {startup-config system-boot} ftp A.B.C.D USRNAME PASSWORD FILENAME	Upload file from remote equipment to FTP server <i>A.B.C.D</i> : Server IP address <i>USRNAME</i> : FTP server username <i>PASSWORD</i> : FTP server password
	upload {startup-config system-boot} tftp A.B.C.D FILENAME	<i>FILENAME</i> : The filename on the server Upload file from remote equipment to TFTP server <i>A.B.C.D</i> : server IP address <i>FILENAME</i> : the filename on the server

- Download remote equipment file from the server to local end

The remote equipment system bootroom file, startup file, startup configuration file and FPGA file can all be downloaded from server to local end using FTP/TFTP protocol, then be saved in local FLASH file system with a designated filename, making preparation for further upgrading.

When local end saves remote file, it will add postfix automatically according to the file type, so the local filename designated by user does not need postfix. What's else, the filename designated by remote file can not be the same with the filename of local end its own in flash. That is, the remote equipment's bootroom file can not be named as system-boot; the remote equipment's startup configure file can not be named as startup-config; the remote equipment's FPGA file can not be named as FPGA. However, the system bootroom file is not saved in FLASH, so the bootroom file of remote equipment can be named as bootstrap.

In privileged EXEC mode, the steps to download remote equipment file from the server to local end are as follows:

Step	Command	Description
1	download {remote-bootstrap remote-system-boot 	<i>A.B.C.D</i> : server IP address <i>USRNAME</i> : FTP server username <i>PASSWORD</i> : FTP server password

remote-startup-config remote-fpga} ftp <i>A.B.C.D USERNAME PASSWORD</i> <i>FILENAME LOCAL-FILENAME</i>	<i>FILENAME</i> : the filename on FTP server <i>LOCAL-FILENAME</i> : the filename saved in local end
download { remote-bootstrap remote-system-boot remote-startup-config remote-fpga} tftp <i>A.B.C.D FILENAME LOCAL-FILENAME</i>	<i>A.B.C.D</i> : server IP address <i>FILENAME</i> : the filename on the server <i>LOCAL-FILENAME</i> : the filename saved on local end

When the downloading is over, you can use **dir** to show the state in privileged EXEC mode on local equipments, and use **erase** to delete.

- Upload remote equipment file from local end to the server

The remote file saved in local equipment's FLASH can be uploaded using FTP/TFTP to the server. The steps are as follows:

Step	Command	Description
1	upload {remote-bootstrap remote-system-boot remote-startup-config remote-fpga} ftp <i>A.B.C.D USERNAME PASSWORD</i> <i>FILENAME LOCAL-FILENAME</i>	<i>A.B.C.D</i> : server IP address <i>USERNAME</i> : FTP server username <i>PASSWORD</i> : FTP server password <i>FILENAME</i> : the filename on FTP server <i>LOCAL-FILENAME</i> : the filename saved in local end
	upload {remote-bootstrap remote-system-boot remote-startup-config remote-fpga} tftp <i>A.B.C.D FILENAME LOCAL-FILENAME</i>	<i>A.B.C.D</i> : server IP address <i>FILENAME</i> : the filename on the server <i>LOCAL-FILENAME</i> : the filename saved on local end

- Download file from local end to remote equipment

The remote file saved in local equipment FLASH, can be downloaded to remote equipment using extended OAM protocol. The function can be started from local equipment or remote equipment. When started from local equipment, several remote equipments can be upgraded at the same time.

Started from local equipment, the steps to download file from local end to remote equipments are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter Ethernet physical interface mode
3	remote-device	Enter remote configuration mode
4	download { bootstrap system-boot fpga } FILENAME download startup-config	Download bootroom file, startup file and FPGA file from local end to remote equipment

<i>[FILENAME]</i>	<i>FILENAME</i> : the filename on local end
	Download configuration file from local end to remote equipment
	<i>FILENAME</i> : the filename on local end

Started from remote end, the steps to download file from local end to remote end are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter ethernet physical interface mode <i>Portid</i> physical port ID
3	download {bootstrap system-boot fpga} FILENAME	Download bootroom file, startup file and FPGA file from local end to remote equipment <i>FILENAME</i> : the filename on local end
	download startup-config [FILENAME]	Download configuration file from local end to remote equipment <i>FILENAME</i> : the filename on local end

When file download is over, you can use **dir** to show the state in privileged EXEC mode on remote equipment and use **erase** to delete.

26.2.7 Configure remote equipment to network management enabled equipment

- Configure remote equipment SNMP community and IP address

The steps to configure remote equipment community name and IP address are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter Ethernet physical interface mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	snmp-server community community-name {ro/rw}	Configure remote equipment community name and priority. <i>community-name</i> community name <i>ro</i> read only <i>rw</i> read & write
		Configure remote equipment IP address <i>ip-address</i> <i>ip-mask</i> <i>vlan-list</i> : the managed VLAN list
5	ip address ip-address [ip-mask] vlan-list	

In remote configuration mode, use **no snmp-server community community-name** to delete remote

equipment community name.

When configuring IP address we need to designate and manage VLAN as well, if the VLAN does not exist, create VLAN (by default all the ports are member port); if related VLAN exists, the member port configuration will not be modified. In remote configuration mode, use **no ip address ip-address** to delete remote port IP address.

In remote configuration mode, use **show remote-device information** to show remote community name and IP address information.

- Configure remote equipment Q-in-Q

Configure remote equipment flexible Q-in-Q function, the attributions that need to be configured include: switch mode, TPID, local VLAN and access interface.

When configuring remote equipment to complete transparent mode, the other configurations, like TPID, local VLAN and access interface, are all not available. The steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	switch-mode transparent	Configure remote equipment to complete transparent mode

When configuring remote equipment to Dot1q VLAN transparent mode, or single TAG mode, local VLAN and access port is valid, while TPID is not. When the equipment is configured to single TAG mode, the data packet coming from the access port will be marked local VLAN ID TAG if it has no TAG; if it has, it will not be handled.

The configuration steps are as follows;

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	switch-mode dot1q-vlan native-vlan <1-4094> [line]	Configure remote equipment to Dot1q VLAN transmission mode native-vlan: local VLAN <1-4094>: VLAN ID; line: Line port is the access port, when the keyword line is not selected, it means that client port is the access port

Configure remote equipment to Double tagged VLAN transmission mode, that is in double TAG mode, TPID, local VLAN and access port are all valid. When the equipment is configured double TAG mode, the data packet coming from the access port will be marked specific TPID and local VLAN ID outer layer TAG, whatever it has TAG or not.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	switch-mode double-tagged-vlan [tpid HHHH] native-vlan <1-4094> [line]	Configure remote equipment to Double tagged VLAN transmission mode native-vlan: local VLAN; <1-4094>: VLAN ID; Line: Line port is the access port tpid: outer-layer tagged TPID HHHH: outer-layer tagged TPID, hexadecimal number, 0000 to FFFF When tpid is not configured, it means the TPID that takes 0x9100 as the outer-layer TAG

In remote configuration mode, run **show remote-device information** to show remote equipment flexible Q-in-Q function related configuration.

26.2.8 Save remote equipment configuration information to local end

When remote equipment belongs to RC552 serious, the equipment itself will not save configuration file, but it is able to save remote configuration content to local end using **writ local**. When the local equipment is rebooted, it will load the saved 552 configuration file, and if there is configuration request from remote 552, the saved configuration will be sent to remote end. The saving steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line lient} portid	Enter ethernet physical interface mode <i>Portid</i> physical port mode
3	remote-device	Enter remote configuration mode
4	write local	Save remote configuration to local FLASH

If there is no 552 configuration file when local end is started, and local end has not sent configuration to remote 552 yet after booting, execute the command and you will be failed.

Saving FLASH file takes a long time, so when executing the command, unusual situations like OAM link

breaking down may happen.

26.2.9 Reset remote equipment

The steps to reset remote equipment are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} portid	Enter ethernet physical port mode <i>Portid</i> physical port ID
3	remote-device	Enter remote configuration mode
4	reboot	Reset remote equipment

You need to confirm you operation after reset command is executed.

When remote equipment is resetting or rebooting, OAM link may break down, and local equipment may lose the connection to remote equipment.

26.2.10 Extended OAM statistic clear function

Extended OAM counts the sending and receiving extended OAM messages number on each OAM link, the extended OAM message types include: variable acquirement and response, variable setting and response, file request and file data, notice and so on. User can follow the steps below to clear statistic information:

Step	Command	Description
1	config	Enter global configuration mode
2	clear extended-oam statistics [port-list port-list] clear extended-oam statistics [line-list line-list] clear extended-oam statistics [client-list client-list]	Clear extended OAM link static information

26.2.11 Monitoring and maintenance

Command	Description
show interface port	Show remote equipment port information
show interface port detail	Show remote equipment port detailed information
show interface port statistics	Show remote equipment port static information
show oam capability	Show remote equipment ability of supporting OAM management

show remote-device information	Show remote equipment basic information
show sfp	Show remote equipment SFP information
show cable-diagnostics	Show link diagnoses result
show inside-loopback	Show remote loopback state and parameter
show extended-oam statistics	Show extended OAM frame static information
show extended-oam status	Show extended OAM link state
show snmp trap remote	Show remote trap enable configuration

26.2.12 Typical configuration example

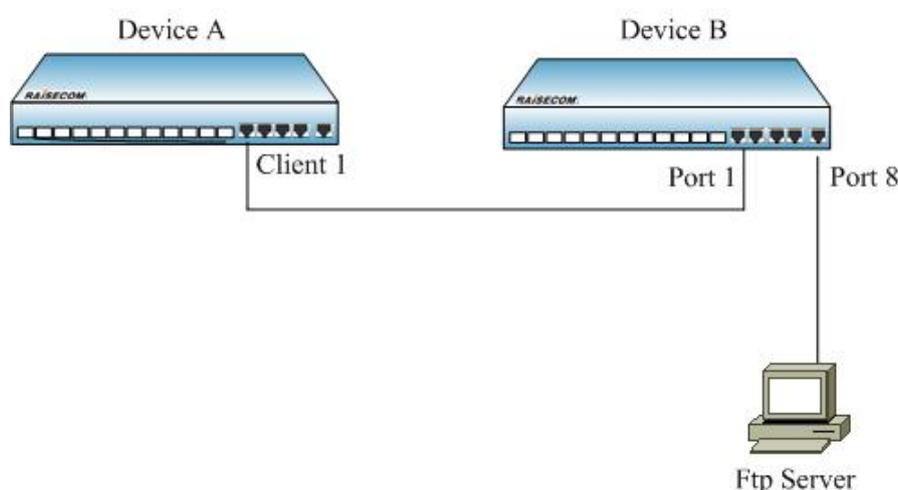

Fig 1 remote file upload/download function typical configuration

If you want to back-up and upgrade device A's startup configuration file on device B, configure B as the steps below:

- 1) upload startup configuration file to the server from remote device

```
Raisecom#config
```

```
Raisecom(config)# interface port 1
```

```
Raisecom (config-port)# remote-device
```

```
Raisecom(config-remote)# upload startup-config ftp 12.0.0.1 raisecom raisecom configfile_version_1
```

- 2) download startup configuration file to remote device from the server:

```
Raisecom(config-remote)# download startup-config ftp 12.0.0.1 raisecom raisecom configfile_version_2
```

27.1 System Overview

This chapter is mainly about how to configure and maintain DHCP snooping on switches, which includes:

- ✧ DHCP Snooping principle
- ✧ DHCP Snooping configuration
- ✧ Monitoring and maintenance
- ✧ DHCP Snooping trouble shooting

27.1.1 DHCP Snooping principle

Introduction:

If there is private DHCP server in the network, user may get wrong IP address. DHCP Snooping is a safe feature of DHCP, it provides network safety by filtrating the unbelievable DHCP message and establishing and maintaining a DHCP Snooping binding database (or DHCP Snooping binding table). To let user get IP address from valid DHCP server, DHCP Snooping safety mechanism allows the port to be set to creditable port and unauthentic port. It divides creditable port from unauthentic port on the switch, filtrates the unauthentic DHCP response message to insure the network safety. It is like firewall between unauthentic host and DHCP server.

Unauthentic DHCP message is the message that the host received from the network or outside the firewall. When DHCP Snooping is used in the network that provides network services, unauthentic message is from other network which does not belong to the server network, like user switch. The messages that are from unknown equipments may be attacking source, so it is unauthentic. At the same time, to make sure the network safety, network administrator may need to record the user's IP address when user is online, to make sure the correspondence relationship between the IP address that user gets from DHCP server and user host MAC address. By monitoring DHCP Request and DHCP ACK broadcast message received by the creditable port, DHCP Snooping records the client MAC address and the IP address acquired to actualize the function.

In the network that provides services, the creditable port is connected with DHCP server; the unauthentic port is connected with client side, or with other equipments in the network. The unauthentic port will drop the DHCP-ACK, DHCP-NAK and DHCP-OFFER message that is received from DHCP response (because these equipments that are connected with unauthentic ports should not make any response to DHCP server); while the response message received b the creditable port will be transmitted normally, which will prevent pseudo-server deception and make sure that user can get the correct IP address.

Fig 1-1 is a typical network picture of DHCP Snooping:

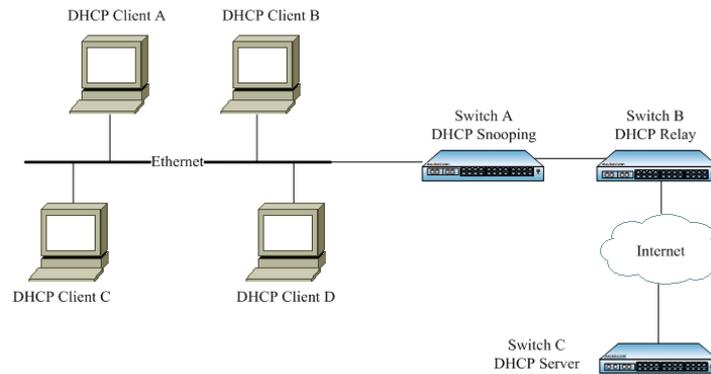

Fig 1-1 DHCP Snooping typical network structure

Option 82 overview:

Option 82 is the Relay Agent Information option of DHCP message, which is identified in request document RFC3046. When DHCP Client sent request message to DHCP Server, if it is needed to cross DHCP Snooping, DHCP Snooping will add Option 82 to request message. Option 82 contains much sub-option. The option 82 introduced here support sub-option 1 and sub-option 2:

sub-option 1: circuit ID is defined in it

sub-option 2: remote ID is defined in it

sub-option 1: sub-option 1 is a sub-option of Option 82, which is circuit ID sub-option. A sub-option is usually configured on DHCP Snooping equipment or repeaters, which defines the port number of the switch port that needs to carry DHCP client when transmitting messages and the port's VLAN number. Usually sub-option1 and sub-option 2 need to be used together to note the information of DHCP source port.

Sub-option 2: it is also a sub-option of Option 82, which is Remote ID. This sub-option is usually also configured on DHCP repeater, which defines the MAC address information of the equipments that carry Snooping or repeater equipment. Usually sub-option 1 needs to be used together to note DHCP source port information.

Option 82 actualize the address information of DHCP client and DHCP snooping equipment or repeater equipment's record on DHCP server, with the help of other software it could actualize DHCP distribution restriction and billing function. For example, combined with IP Source Guard, the reception of IP address + MAC address can be defended effectively.

Option 82 handling actions:

- When the switch receives a request message without Option 82 words, if it supports Option 82, Option 82 will be added and transmitted.
- When the switch receives a request message without Option 82 words, if it supports Option 82, Option 82 will be transmitted; if not, the message will be dropped.
- When the switch receives a request message without Option 82 words, if it supports Option 82, Option 82 will be deleted and transmitted; if not, the message will be dropped.

The structure of Option 82 message:

Option 82 obeys 'TLV' option format, fig 1-2 shows its message structure:

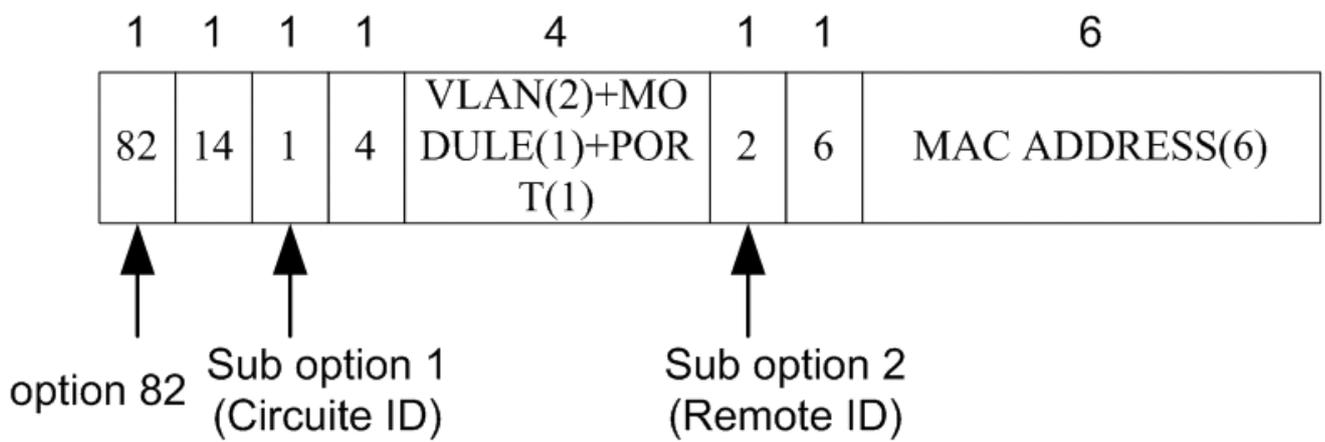

Fig 1-2 Option 82 message structure

27.1.2 Configure DHCP Snooping

The part describes how to configure DHCP Snooping on the switch, including:

- ✧ Default DHCP Snooping configuration
- ✧ DHCP Snooping configuration guide
- ✧ Global DHCP Snooping configuration
- ✧ Port trust configuration
- ✧ DHCP Snooping supporting Option 82 configuration

27.1.2.1 Default DHCP Snooping configuration

Function	Default value
Global DHCP Snooping state	Disabled
Port DHCP Snooping state	Enabled
Port trust state	Untrusted
DHCP Snooping supporting Option 82	Disabled

27.1.2.2 DHCP Snooping configuration guide

- Make sure that the switch DHCP Server or DHCP Relay is not enabled;
- Global DHCP Snooping must be enabled;
- If DHCP Snooping is not enabled on the port, DHCP Snooping can not is not available on the switch;
- After DHCP Snooping is on, DHCP Server or DHCP Relay can not be started on the switch;
- If only DHCP Snooping is enabled, while DHCP Snooping supporting Option 82 is not, the switch will not insert Option 82 in the message nor handle the message that contains Option 82;
- Make sure the port that connects DHCP server is credible, while the port that connects client side is incredible.

27.1.2.3 Configure global DHCP Snooping

By default, global DHCP Snooping is off. Only when global DHCP Snooping is enabled can the switch DHCP Snooping take effect. To enable global DHCP Snooping, take the following steps:

The configuration step is shown below:

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp snooping	Enable global DHCP Snooping
3	exit	Return to privileged EXEC mode
4	show ip dhcp snooping	Show DHCP Snooping configuration

Note: If the switch enables DHCP Server or DHCP Relay, global DHCP Snooping can not be started. On the opposite, if the switch enables DHCP Snooping, DHCP Server or DHCP Relay can not be started.

Use global configuration command **no ip dhcp snooping** to disable global DHCP Snooping.

27.1.2.4 Configure port DHCP Snooping

By default, DHCP Snooping is on, use **no ip dhcp snooping port-list** to close port DHCP Snooping.

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp snooping port-list 4-9	Enable DHCP Snooping on port 4-9
3	exit	Return to privileged EXEC mode
4	show ip dhcp snooping	Show DHCP Snooping configuration

Notice: By default, all the ports' DHCP Snooping of the switch is on. But until global DHCP Snooping is on can they be available. That is to say, if global DHCP Snooping is off, and only port DHCP Snooping is on, DHCP Snooping can not take effect.

27.1.2.5 Configure port trust

Unauthentic port will drop DHCP-ACK, DHCP-NAK, DHCP-OFFER message received from DHCP server response (because these equipments connected by unauthentic ports should not make any DHCP server response). While the DHCP server response message received by credible port will be transmitted normally.

Credible port connects DHCP server or the ports of others switches, while unauthentic port connects user or network, which keeps away from server deception, and makes sure user can get the correct IP address.

Follow the steps below to set the designated port to credit port.

Step	Command	description
------	---------	-------------

1	config	Enter global configuration mode
2	interface port 15	Enter port configuration mode
3	ip dhcp snooping trust	Configure credit port
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show ip dhcp snooping	Show DHCP Snooping configuration

Notice: Only when port trust is started in global DHCP Snooping and the port has also started DHCP Snooping can it take effect. Use **no ip dhcp snooping trust** to set the port to unauthentic port.

In port configuration mode use **no ip dhcp snooping trust** to set the port to unauthentic port and delete it from trust port list.

27.1.2.6 Configure DHCP Snooping supporting Option 82

Following the steps below, user can enable DHCP Snooping supporting Option 82, and the switch will add Option 82 option into the DHCP request message that receives Option 82; delete Option 82 in the DHCP response message that contains Option 82. The received DHCP request message that contains Option 82 will be handled according to the configured strategy and transmitted, while to the response message that don't contain Option 82 option, the switch will not take any action and transmit it directly.

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp snooping information option	Enable DHCP Snooping supporting Option 82
3	exit	Return to privileged EXEC mode
4	show ip dhcp snooping	Show DHCP Snooping configuration

Notice: DHCP Snooping supporting Option 82 function is global, but it reacts on the port. It can be enable only in global DHCP Snooping, and only when the port start DHCP Snooping can Option 82 take effect on the port.

Use global configuration command **no ip dhcp snooping information option** to stop DHCP Snooping supporting Option 82.

27.1.3 Monitoring and maintaining

Use the command **show** to look over the switch DHCP Snooping running state and configuration state and help monitoring and maintaining.

Command	Description
show ip dhcp snooping	Show DHCP Snooping configuration

Use **show ip dhcp snooping** to show DHCP Snooping configuration information, including global DHCP Snooping state, if Option 82 is supported, port DHCP Snooping state and port trust. Specific steps are as follows:

Raisecom#**show ip dhcp snooping**

DHCP Snooping: Enabled

Option 82: Enabled

<i>Port</i>	<i>Enabled Status</i>	<i>Trusted</i>
1	<i>enabled</i>	<i>no</i>
2	<i>enabled</i>	<i>no</i>
3	<i>enabled</i>	<i>no</i>
4	<i>enabled</i>	<i>no</i>
5	<i>enabled</i>	<i>no</i>
6	<i>enabled</i>	<i>no</i>
7	<i>enabled</i>	<i>no</i>
8	<i>enabled</i>	<i>no</i>
9	<i>enabled</i>	<i>no</i>
10	<i>enabled</i>	<i>no</i>
11	<i>enabled</i>	<i>no</i>
12	<i>enabled</i>	<i>no</i>
13	<i>enabled</i>	<i>no</i>
14	<i>enabled</i>	<i>no</i>
15	<i>enabled</i>	<i>yes</i>
16	<i>enabled</i>	<i>no</i>
17	<i>enabled</i>	<i>no</i>
18	<i>enabled</i>	<i>no</i>
19	<i>enabled</i>	<i>no</i>
20	<i>enabled</i>	<i>no</i>
21	<i>enabled</i>	<i>no</i>
22	<i>enabled</i>	<i>no</i>
23	<i>enabled</i>	<i>no</i>
24	<i>enabled</i>	<i>no</i>
25	<i>enabled</i>	<i>no</i>
26	<i>enabled</i>	<i>no</i>

27.1.4 Typical configuration example

This part gives a introduction to a example that a DHCP client connects DHCP server and get IP address dynamically through DHCP Snooping, it show the typical configuration of DHCP Snooping.

1. Configuration explanation:

This example is a simple and typical DHCP configuration, the two DHCP clients use DHCP port 2, 3 respectively to connect DHCP server.

- Configure the correct address pool on DHCP Server, and enable DHCP Server function globally.
- Enable DHCP Snooping function globally on DHCP Snooping equipment, and enable DHCP Snooping on the port, set port 1 to credible port, and configure DHCP Snooping supporting Option 82, use the default strategy Replace to handle the request messages from client side.

2. Topology picture

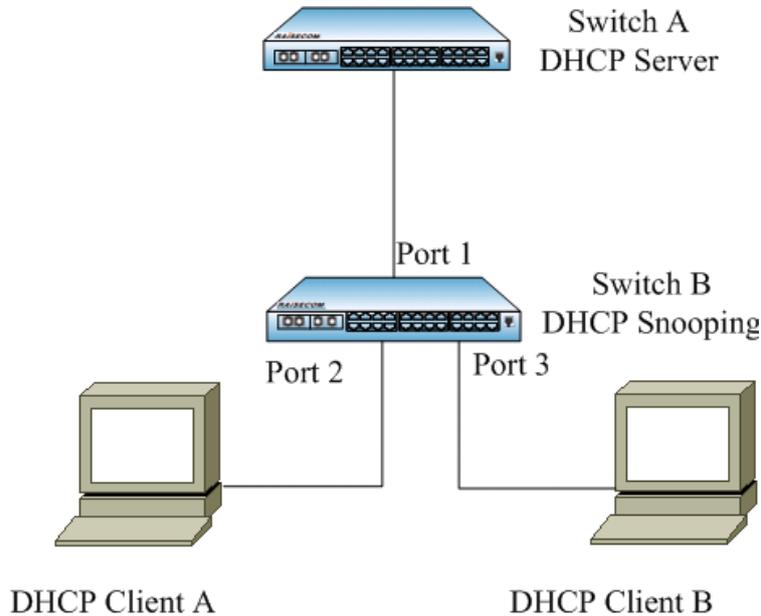

Fig 1-3 Typical DHCP Snooping configuration topology

3. Configuration step

Configure DHCP Snooping:

- Enable global DHCP Snooping:

```
Raisecom#config
```

```
Raisecom(config)#ip dhcp snooping
```
- Port enable DHCP Snooping:

```
Raisecom(config)# ip dhcp snooping port-list 1-3
```
- Set port 3 to DHCP Snooping credible port:

```
Raisecom(config)# interface port 1
```

```
Raisecom(config_port)# ip dhcp snooping trust
```
- Enable DHCP Snooping supporting Option 82:

```
Raisecom(config)#ip dhcp snooping information option
```

4. Show the result

On ISCOM switch use command **show ip dhcp snooping** to look over the switch DHCP Snooping running state and configuration state, on the client side use **show ip dhcp client** to show client IP address application. Specific contents are as follows:

Raisecom#show ip dhcp snooping

DHCP Snooping: Enabled

Option 82: Enabled

	<i>Port</i>	<i>Enabled Status</i>	<i>Trusted</i>

1	<i>enabled</i>	<i>yes</i>	
2	<i>enabled</i>	<i>no</i>	
	3	<i>enabled</i>	<i>no</i>

Raisecom#show ip dhcp client

```

    Hostname:          raisecomFTTH
    Class-ID:          raisecomFTTH-3.6.1025
    Client-ID:         raisecomFTTH-000e5e8a0798-IF0
    Assigned IP Addr:  10.0.0.5
    Subnet mask:       255.0.0.0
    Default Gateway:   10.0.0.1
    Client lease Starts: Jan-01-2007 08:00:41
    Client lease Ends:  Jan-11-2007 11:00:41
    Client lease duration: 874800(sec)
    DHCP Server:       10.100.0.1

    Tftp server name:  --
    Tftp server IP Addr: 10.168.0.205
    Startup_config filename: 2109.conf

```

27.1.5 DHCP snooping trouble shooting

If DHCP client can not get network address normally through DHCP Snooping, it may be one of the following situations:

- If global DHCP Snooping and port DHCP Snooping are enabled at the same time;
- If DHCP Snooping do not open Option 82 option, when DHCP Snooping receives the message that contains Option 82 it will be dropped directly;
- If DHCP Snooping Option 82 option is enabled, and the request message handling strategy is set to be DROP, then the messages that contain Option 82 will be dropped;
- If the port is not configured as DHCP Snooping credible port, all the response messages to the ports mentioned above will be dropped.

If the configuration above still can not help, please examine if the equipment that opened DHCP Snooping has opened router function, examine if the DHCP server address is correct.

27.2 DHCP Server Configuration

This chapter is mainly about how to configure and maintain DHCP Server on the switch, including:

- ✧ DHCP Server principle overview

- ◇ DHCP Server configuration
- ◇ Monitoring and maintaining
- ◇ Typical configuration example
- ◇ DHCP Server trouble shooting

27.2.1 DHCP Server principle overview

Dynamic Host Configuration Protocol (DHCP) let the client acquire configuration information protocol in TCP/IP network, which is based on BOOTP protocol, and adds the function of automatic distribution useful network address and so on based on BOOTP protocol. The two protocol can make interoperability through some mechanism. DHCP offers the network hosts configuration parameters, which are made of two parts: one is to transmit special configuration information to network hosts, the other one is to assign network addresses to the hosts. DHCP is based on client/server mode, in this mode specific host assigns network addresses and transmits network configuration parameters to network hosts, the designated hosts are called server.

Usually, in the following situations DHCP server will be used to accomplish IP address distribution:

- (1) When the network scope is too large for manual configuration or centralized management to the whole network.
- (2) When the network host number is larger than the IP address number that the network supports, and can not give each host a stable IP address; there is also user number limit who can get into the network at the same time (for example, Internet access service provider belongs to the situation), lots of users have to acquire their own IP address dynamically from DHCP server.
- (3) When there is not so many hosts who need stable IP address, and most hosts have no the need for stable IP address.

In typical DHCP application, there is usually one DHCP server and several client (like PC and portable machine), the typical DHCP application is shown below:

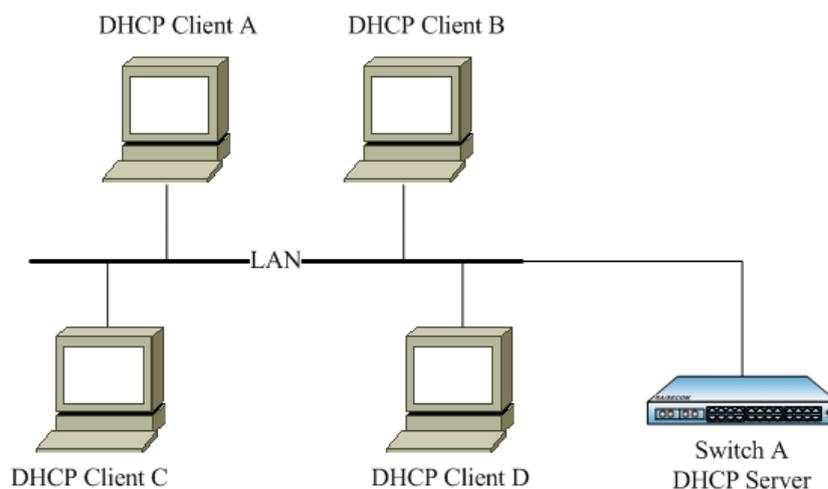

Fig 2-1 DHCP typical usage

27.2.2 Configure DHCP Server

This part is mainly about how to configure DHCP Server on the switch, including:

- ✧ Default DHCP Server configuration
- ✧ DHCP Server configuration guide
- ✧ Global DHCP Server configuration
- ✧ IP interface DHCP Server configuration
- ✧ Address pool configuration
- ✧ Lease table timeout configuration
- ✧ Border upon surrogate IP address configuration

Notice: Only ISCOM3000 serial switches support border upon surrogate IP address configuration.

27.2.2.1 Default DHCP Server configuration

Function	Default value
Global DHCP Server state	Disabled
IP port DHCP Server state	Disabled
Address pool	N/A
Lease table timeout	Maximum timeout: 1080 minutes Least timeout: 30 minutes Default timeout: 30 minutes
Neighbour proxy address	N/A

27.2.2.2 DHCP Server configuration guide

1. Make sure that DHCP Snooping on the switch is not on;
2. Global DHCP Server must be enabled;
3. If DHCP Server is not enable in IP port, DHCP Server does not take effect on this IP port;
4. When DHCP Server is on, DHCP Snooping can not be started either on the switch;
5. Make sure that the connection to DHCP Relay and DHCP server is correct, and the IP port address and the corresponding address pool range is correct.
6. If the client connect DHCP server through DHCP Relay, DHCP server must be ISCOM3000 serial switches. Except making sure IP port address and address pool configuration correct, correct configuration to neighbour proxy address and DHCP Relay.

27.2.2.3 Configure global DHCP Server

By default, global DHCP Server is disabled. Only when global DHCP Server is enabled, the switch DHCP Server can take effect. User can follow the steps below to start global DHCP Server:

Step	Command	Description
1	config	Enter global configuration mode

2	ip dhcp server	Enable global DHCP Server
3	exit	Return to privileged EXEC mode
4	show ip dhcp server	Show DHCP Server configuration

Notice: If DHCP Snooping has been started on a switch, global DHCP Server can not be started any more. On the opposite, if global DHCP Server has been started, DHCP Snooping can not be started.

Use global configuration command **no ip dhcp server** to close global DHCP Server.

27.2.2.4 Configure IP port DHCP Server

By default, IP port DHCP Server function is disabled as well, user can use IP port command **ip dhcp server** to start IP port DHCP Server function. To close IP port DHCP Server, use IP port command **no ip dhcp server**.

Step	Command	Description
1	config	Enter global configuration mode
2	interface ip 4	Enter IP port 4 configuration mode
3	ip dhcp server	Enable DHCP Server
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show ip dhcp server	Show DHCP Server configuration

Notice: When global DHCP Server is off, user can start DHCP Server beforehand on a certain IP interface, but only when global DHCP Server starts, can the DHCP Server started from the IP port take effect.

27.2.2.5 Configure address pool

DHCP server selects and distributes IP address and other parameters from the address pool for the client. When the equipment that is selected as DHCP server receives a DHCP request from the client, it will select proper address pool by configuration, and then pick out a free IP address, which will sent out to the client together with other parameters (like DNS server address, address lease limit). Lots of standard configuration option is identified in RFC2132, where more detailed information can be got there. But most DHCP configurations use only a few options of the rules.

Following the steps below user can configure address pool:

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp sever ip-pool WORD start-ip-address end-ip-address mask-address ip <0-14> [gateway	Configure the address pool

	<i>ip-address</i>] [dns <i>ip-address</i>] [secondary-dns <i>ip-address</i>]	
3	exit	Return to privileged EXEC mode
4	show ip dhcp server ip-pool	Show DHCP Server address pool configuration

Notice:

- The command can configure one address pool to IP interface once. If IP interface does not exist when configuring, still the address pool can be successfully configured, but it will not take effect until the IP port is created and the IP address is configured. If the IP port is changed or deleted, the configured address pool can still be kept. Once the IP port is re-created, the configured address pool will take effect again.
- If the client and the server is in the same subnet, when configuring IP address pool, the network section that the address pool is in should be the same with the network section that of IP port address's, that is to say, address pool's network address is the same with the port's network address; if the client connects the server through DHCP Relay, then the server's address and relay-ip should be within the same network section. Otherwise, DHCP Server will not distribute IP address for DHCP client.

Use global configuration command **no ip dhcp server ip-pool** ip-pool to delete the configured address pool. If the IP address pool that is to be deleted does not exist, returned value is fault.

Here, the maximum IP address pool number that can be configured for each IP port is 4, the maximum IP address number that the switch supports is 2500. Address pool take the name as the only mark.

Configuration example:

Raisecom#**config**

Raisecom(config)#**ip dhcp server ip-pool** pool1 192.168.1.100 192.168.1.200

255.255.255.0 **ip 4 gateway** 192.168.1.1 **dns** 192.168.1.1 **secondary-dns** 10.168.0.1

Raisecom(config)#**exit**

Raisecom#**show ip dhcp server ip-pool**

The result is shown below

Name of ip pool table : pool1

Status of IP pool table: active

IP address range: 192.168.1.100 - 192.168.1.200

Mask: 255.255.255.0

Including IP Interface: 4

IP address of gateway: 192.168.1.1

IP address of DNS server: 192.168.1.1

IP address of secondary DNS server: 10.168.0.1

Valid IP pool count : 1

Valid IP address count : 12

Allotted IP address count : 0

Gateway and dns is optional, if they are not used, default gateway and DNS will not be selected for the client.

27.2.2.6 Configure lease table timeout

When distributing IP address for the client, it is needed to designate the lease time of the IP address. By default the system lease time is:

- 1: default lease time: 30 minutes (usually it will not be used);
- 2: the maximum lease time: 10080 minutes (7days), when the lease time that the client requests is larger than this value, the larger value will be used.
- 3: the least lease time: 30 minutes, when the lease time that the client requests is smaller than this value, least lease time will be used; otherwise, according to the request time, if the client does not designate lease time, use the least lease time for distribution.

If the administrator needs to modify the least lease time, manual configuration is needed.

The configuration step is as follows:

Step	Command	Description
1	config	Enter global configuration mode
2 (optical)	ip dhcp server default-lease <i>timeout</i>	Configure the IP address pool default lease time for DHCP server
3 (optical)	ip dhcp server max-lease <i>timeout</i>	Configure the IP address pool maximum lease time for DHCP server
4 (optical)	ip dhcp server min-lease <i>timeout</i>	Configure the IP address pool least lease time for DHCP server
5	exit	Return to privileged EXEC mode
6	show ip dhcp server	Show DHCP server configuration

Notice: The lease time configured here is used for all the IP address of the address pool. At the same time, the maximum lease time can not be shorter than least rent time, default lease time must be between maximum and least lease time.

Use global command **no ip dhcp server default**, **no dhcp-server max-lease**, **no dhcp-server min-lease** to cancel the current setting, and restore system default lease time setting.

Configuration example:

```
Raisecom#config
Raisecom(config)#ip dhcp server default-lease 60
Raisecom(config)#ip dhcp server max-lease 1440
Raisecom(config)#ip dhcp server min-lease 45
Raisecom(config)#exit
Raisecom#show ip dhcp server
```

The result is shown below:

DHCP Server: Enabled

IP Interface Enabled: 4

Total Number: 1

Max lease time: 1440 m

Min lease time: 40 m

Default lease time: 60 m

27.2.2.7 Configure neighbour proxy IP address

When the client is connected with the server by DHCP Relay, DHCP server must know the neighbour DHCP Relay IP address, which needs the administrator's manual configuration as well.

The configuration step is shown below:

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp sever relay-ip <i>ip-address ip-mask</i>	Configure neighbour proxy IP address
3	exit	Return to privileged EXEC mode
4	show ip dhcp server relay-ip	Show DHCP server configuration

Notice: Only ISCOM3000 serious switches support the command **ip dhcp server relay-op**. Here the configured neighbour proxy IP address is actually the port address that is connected with the client, as is shown in the typical example. The maximum number of neighbour proxy IP address is 8.

Use global configuration command **no ip dhcp server relay-ip** ip-address to delete neighbour proxy IP address configuration.

Configuration example:

```
Raisecom#config
```

```
Raisecom(config)#ip dhcp server relay-ip 192.168.1.1 255.255.255.0
```

```
Raisecom(config)#exit
```

```
Raisecom#show ip dhcp server relay-ip
```

The result is shown below:

```
index IP address IP Mask Status  
-----  
1 192.168.1.1 255.0.0.0 active
```

27.2.3 Monitoring and maintaining

Use different **show** commands to show the switch DHCP Server running and configuration situation for monitoring and maintaining. All the show commands are listed below:

Command	Description
show ip dhcp server	Show DHCP Server configuration and static information
show ip dhcp server ip-pool	Show DHCP Server address pool information
show ip dhcp server relay-ip	Show the configured neighbour DHCP proxy address information
show ip dhcp server lease	Show the designated IP address and the corresponding information

Notice: Only ISCOM3000 serial switches supports the command **show ip dhcp server relay-ip**. Before using **show ip dhcp server lease**, the system time should better be configured accurately, because lease time limit is computed according to the system date absolute time.

Use **show ip dhcp server** command to look over the configuration information, like global or IP port configuration information, static information or so.

Raisecom#show ip dhcp server

In English:

DHCP Server: Enabled

IP Interface Enabled: 4

Total Number: 1

Max lease time: 1000 m

Min lease time: 32 m

Default lease time: 300 m

Statistics information:

Running time: 0 hours 7 minutes 33 seconds

Bootps: 0

Discover: 0

Request: 0

Release: 0

Offer: 0

Ack: 0

Nack: 0

Decline: 0

Information: 0

Unknowns: 0

Total: 0

Use the command **show ip dhcp server ip-pool** to show the configured address pool information:

Raisecom#**show ip dhcp server ip-pool**

```
-----  
Name of IP pool table: dhcp  
Status of IP pool table: active  
IP address range: 11.1.1.33 - 11.1.1.44  
Mask: 255.255.255.0  
Including IP Interface: 4  
IP address of gateway: 0.0.0.0  
IP address of DNS server: 0.0.0.0  
IP address of secondary DNS server: 0.0.0.0  
-----
```

```
Valid IP pool count: 1  
Valid IP address count: 12  
Allotted IP address count: 0
```

Use the command **show ip dhcp server relay-ip** to show the configured neighbour proxy address information:

Raisecom#**show ip dhcp server relay-ip**

<i>Index</i>	<i>IP Address</i>	<i>IP Mask</i>	<i>Status</i>
1	11.1.1.34	255.255.255.0	active

Use the command **show ip dhcp server lease** to show the configured neighbour proxy address information

Raisecom#**show ip dhcp server lease**

<i>IP Address</i>	<i>Hardware Address</i>	<i>Lease Expiration</i>	<i>IP Interface</i>
172.16.1.11	00:a0:98:02:32:de	Feb-01-2006 11:40:00	1
172.16.3.254	02:c7:f8:00:04:22	Jul-01-2006 23:00:00	1

Character instruction:

IP Address: the client IP address;

Hardware Address: the client MAC address

Lease Expiration: lease timeout limit

IP Interface: IP interface number

Lease timeout limit is computed according to system date, format is mm-dd-yyy hh:mm:ss

27.2.4 Typical configuration example

The typical DHCP Relay and Server configuration case is show below:

- ✧ Direct connection to the client for IP address
- ✧ The client get IP address through proxy

1) Configuration instruction

The example is simple and typical in realizing DHCP protocol. Specific connection state is shown in fig 2-2. In the figure ISCOM3026, as DHCP Relay, divides the two VLAN: VLAN 10 and VLAN 20, the two corresponding subnet IP address are 192.168.1.10 and 172.168.1.10 respectively. The DHCP server is ISCOM3026A, IP address is 172.168.1.2, suppose the subnet NDS be 172.168.1.3, subnet 1 and subnet 2 need to get connection to public network through gateway 172.168.1.1. To realize the client accessing the resource of the public network, it is only needed to configure DHCP Server and DHCP Relay correctly.

2) Topology figure

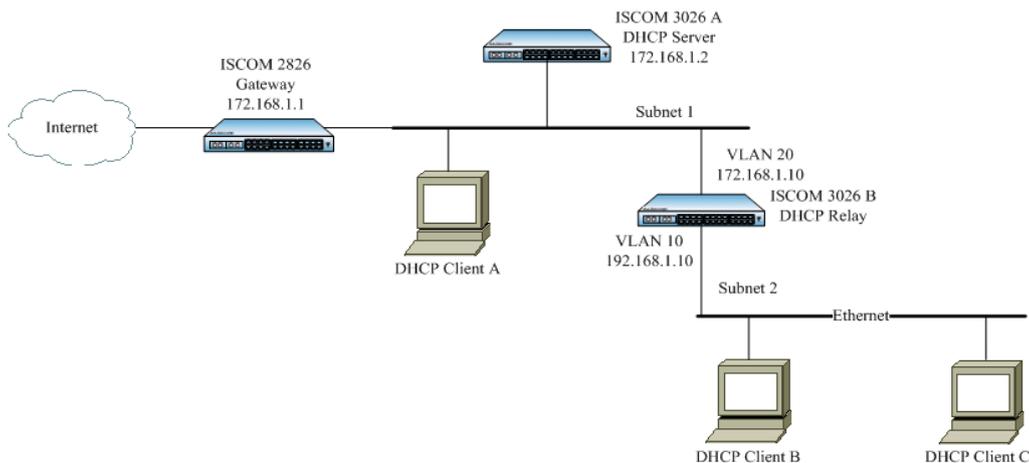

Fig 2-2 typical configuration example

3) Configuration steps

Configure DHCP Server:

- Configure VLAN and interfaces:

```
Raisecom(config)#create vlan 20 active
```

```
Raisecom(config)#interface port 1
```

```
Raisecom(config-port)#switchport access vlan 20
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#interface ip 2
```

```
Raisecom (config-ip)#ip address 172.168.1.2 255.255.0.0 20
```

- Configure address pool

Configuring a address pool for both subnet 1 and subnet 2 respectively.

```
Raisecom (config)#ip dhcp server ip-pool pool1 172.168.1.100 172.168.1.200 255.255.0.0 ip 2 gateway 172.168.1.1 dns 172.168.1.3
```

```
Raisecom(config)#ip dhcp server ip-pool pool2 192.168.1.100 192.168.1.200 255.255.255.0 ip 2 gateway 172.168.1.1 dns 172.168.1.3
```

```
Raisecom (config)#exit
```

```
Raisecom #show ip dhcp server ip-pool
```

- Start DHCP Server service

```
Raisecom (config)#ip dhcp server
```

```
Raisecom(config)#interface ip 2
```

```
Raisecom(config-ip)#ip dhcp server
```

```
Raisecom #show ip dhcp server
```

- Configure neighbour proxy IP address

```
Raisecom (config)#ip dhcp server relay-ip 192.168.1.10 255.255.255.0
```

```
Raisecom (config)#exit
```

```
Raisecom #show ip dhcp server relay-ip
```

- Configure the router

```
Raisecom (config)#ip route 192.168.1.0 255.255.255.0 172.168.1.10
```

- Configure DHCP Relay

Create VLAN and the interface

```
Raisecom (config)#create vlan 10 active
```

```
Raisecom (config)#interface port 1
```

```
Raisecom(config-port)#switchport access vlan 10
```

```
Raisecom(config-port)#exit
```

```
Raisecom (config)#interface ip 2
```

```
Raisecom(config-ip)#ip address 192.168.1.10 255.255.255.0 10
```

```
Raisecom (config)#create vlan 20 active
```

```
Raisecom (config)#interface port 2
```

```
Raisecom(config-port)#switchport access vlan 20
```

```
Raisecom(config-port)#exit
```

```
Raisecom (config)#interface ip 3
```

```
Raisecom (config-ip)#ip address 172.168.1.10 255.255.0.0 20
```

- Enable router function

Raisecom(config-ip)#exit

Raisecom(config)#**ip routing**

- Configure DHCP server IP address

Raisecom(config)#**ip dhcp relay ip-list 2 target-ip 172.168.1.2**

Raisecom (config)#exit

Raisecom #**show ip dhcp relay**

- Start DHCP Relay

Raisecom (config)#**ip dhcp relay**

Raisecom(config)#exit

Raisecom #**show ip dhcp relay**

The client will be configured as auto acquiring IP address through DHCP

4) show the result

Show DHCP configuration static information, address pool information and the configured IP address information

On ISCOM3026A use the command **show ip dhcp server**、**show ip dhcp server ip-pool** and **show ip dhcp server lease**.

Show DHCP Relay information

On ISCOM3026B use the command **show ip dhcp relay**.

- Show client A

27.3 DHCP Relay Configuration

This chapter is mainly about how to configure and maintain DHCP Relay on the switch, including:

- ✧ DHCP Relay principle overview
- ✧ DHCP Relay configuration
- ✧ Monitoring and maintaining
- ✧ Typical configuration example
- ✧ DHCP Relay trouble shooting

27.3.1 DHCP Relay principle overview

Early DHCP protocol is suitable for only the situation that the client and server are in the same subnet, which can not go through network sections. Therefore, for dynamical host configuration, configuring a DHCP server on all the network sections is needed, which is obviously wasteful.

The introduction of DHCP Relay solves this problem: the local network client can communicate with the other subnet DHCP servers by DHCP Relay, and get the legal IP address finally. Thus, the DHCP

client on several networks can use the same DHCP server, which decreases the cost and helps centralized management

DHCP Relay provides DHCP broadcast message transparent transmission function, which is able to transmit the broadcast message of DHCP client (or server) transparently to the other network section DHCP server (or client).

In the process that DHCP Relay completes dynamic configuration, the processing way that DHCP client and server takes is basically the same with that of not through DHCP Relay. The following steps are only about DHCP Relay transmission:

- (1) DHCP client transmits DHCP-DISCOVER message in broadcasting.
- (2) When the network equipment with DHCP Relay function receives the broadcast message, by configuration it will transmit the message to the specific DHCP server in unicast.
- (3) DHCP server makes IP addresses distribution, and sends the configuration information to the client through DHCP Relay.

Usually, DHCP Relay can be either host or three-layer switch or router, if only DHCP Relay service program is enable.

The figure below is a typical DHCP Relay application:

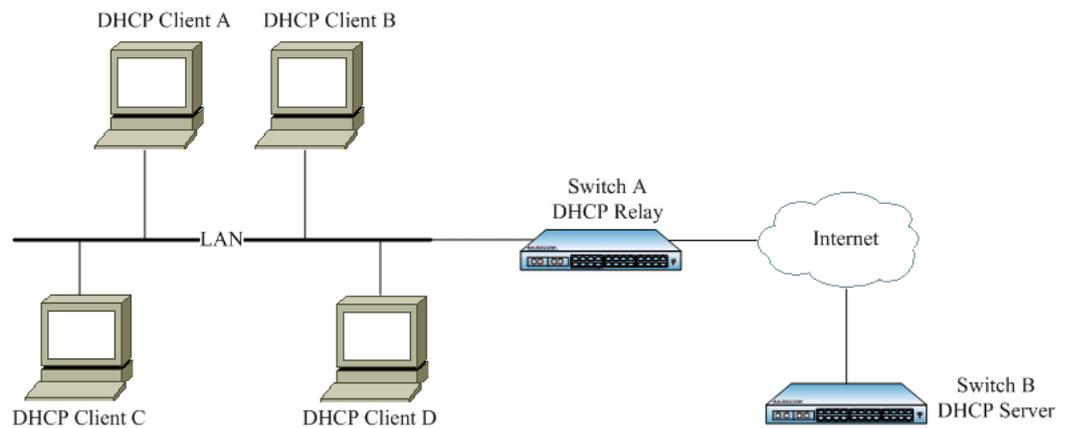

Fig 3-1 DHCP Relay typical application

The mechanism of DHCP Relay support Option 82 is shown below:

- (1) DHCP client sends out request message in the form of broadcast when initialized.
- (2) The DHCP Relay equipment that is connected with local network will receive the broadcast message, check out if there has been Option 82 in the message, and handles it in the corresponding way.
- (3) If there has been Option 82 in the message, the equipment will follow the configured strategy to handle the message (drop, replace the Option 82 in the message that has been there with the relay equipment's Option 82 or keep the Option 82 that has been there), and transmits the request message to DHCP server.
- (4) If there is no Option 82 in the request message, the Option 82 of DHCP equipment will be added into the message (located in the end of all the options) and be transmitted to DHCP server. At this time, the Option 82 of the request message contains the port number of the switch which is connected with DHCP client, the number of the VLAN that the port belongs to and the DHCP Relay

equipment's own MAC address and so on.

(5) When DHCP server receives the DHCP request message that is transmitted by DHCP Relay equipment, it will record the information from Option in the message, then transmit the message that contains DHCP configuration information and Option 82 information.

(6) After DHCP Relay receives the response message of DHCP server it will peel off the message's Option 82 information, then transmit the message that contains DHCP configuration information to DHCP client.

Explanation: there are two sorts of request messages from DHCP client, DHCP-DISCOVER and DHCP-REQUEST message. Because of the different mechanisms that different manufacturers' DHCP server handle request messages, some equipments handle DHCP-DISCOVER message's Option 82 information, while some others handle DHCP-REQUEST message's Option 82 information, so DHCP Relay handles both the two messages in the strategy of Option 82.

Otherwise, if DHCP Relay receives the messages sent out from the two DHCP client DHCP-DECLINE and DHCP-INFORM, it will handle Option 82 uniformly according to the strategy, without affecting its basic function of supporting Option 82.

27.3.2 Configure DHCP Relay

This part is about how to configure DHCP Relay on the switch, including the following configuration information:

- ✧ Default DHCP Relay configuration
- ✧ DHCP Relay configuration guide
- ✧ Global DHCP Relay configuration
- ✧ IP port DHCP Relay configuration
- ✧ DHCP Relay support Option 82 configuration
- ✧ DHCP Relay's handling strategy to the request messages that contains option 82 configuration
- ✧ Port DHCP Relay trust configuration

27.3.2.1 Default DHCP Relay configuration

The following table is the default configuration steps of DHCP Relay:

Function	Default value
Global DHCP Relay state	Disabled
IP port DHCP Relay state	Enabled
IP port's destination IP address	N/A
DHCP Relay support Option 82	Disabled
The strategy of DHCP Relay handling option 82 request messages	Replace

Port DHCP Relay trust	Untrusted
-----------------------	-----------

27.3.2.2 DHCP Relay configuration guide

1. Make sure the DHCP Snooping on the switch is not started;
2. Global DHCP Relay must be started;
3. If on a IP port DHCP Relay is not started, it can not work on this IP port;
4. When DHCP Relay is on, DHCP Snooping can not be started either on the switch;
5. Make sure the DHCP server that is connected with DHCP Relay has correct configuration and connection to the client. DHCP server must be ISCOM 3000 serious switches. Except making sure the correct configuration of IP port addresses and address pool, correct configuration to the neighbour proxy address and Relay addresses;
6. If the client acquires IP address automatically from DHCP server through multiplex Relay, you must make sure the connection of each equipment and correct configuration. The DHCP Relay number between the client and server, can not exceed 16 in RFC1542 rules, it is usually suggested not to exceed 4.

27.3.2.3 Configure global DHCP Relay

By default, global DHCP Relay is off. Only when global DHCP Relay is on can the switch DHCP Relay takes effect. User can take the following steps to start global DHCP Relay.

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp relay	Start global DHCP Relay
3	exit	Return to privileged EXEC mode
4	show ip dhcp relay	Show DHCP Relay configuration

Notice: If the switch starts DHCP Snooping, it can not start global DHCP Relay. On the opposite, if the switch starts global DHCP Relay, it can not start DHCP Snooping.

Use global command **no ip dhcp relay** to disable global DHCP Realy.

27.3.2.4 Configure IP port DHCP Relay

By default, IP port DHCP Relay function is on, user can use IP port command **no ip dhcp relay** to disable IP port DHCP Relay function. To start IP port DHCP Relay, use IP port command **ip dhcp relay**.

Step	Command	Description
1	config	Enter global configuration mode

2	interface ip 4	Enter IP port 4 configuration mode
3	ip dhcp relay	Start DHCP Relay
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show ip dhcp relay	Show DHCP Relay configuration

Notice: When global DHCP Relay is off, on a certain IP port DHCP Relay can be started in advance. But only when global DHCP Relay starts can the DHCP Relay started on this port takes effect.

27.3.2.5 Configure IP port destination IP address

When the client equipment and DHCP server is not in the same broadcasting domain, the relay equipment in the middle must be able to transmit the kind of broadcasting packet. Configuring the destination IP address of DHCP Relay points out the destination address of the DHCP broadcasting packet from DHCP client for the relay equipment.

When DHCP Relay is configuring destination IP address, use network port LIST for the convenience of user's configuration. That is to say, according to the actual need, one command can be used to configure the same IP address for parts of the network ports or all the ports.

When DHCP Relay is configuring destination IP address, except the configuration commands in config mode, you can also configure the port's corresponding destination IP address in IP port, which is flexible.

Take the following steps to configure the port's destination IP address.

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp relay ip-list all target-ip <i>10.199.0.200</i>	For all the IP ports configure the destination IP 10.199.0.200
3	ip dhcp relay ip-list 1-3 target-ip	For IP port 1-3 configure the destination IP 10.200.0.200
4	interface ip 3	Enter IP port 3 configuration mode
5	ip dhcp relay target-ip	Configure the destination IP 10.201.0.200
6	exit	Return to global configuration mode

Note:

- Here, the configured maximum destination IP address number for each port is 4. At the same time, make sure that the destination IP address is correct.
- When it comes to configuring destination IP address for several IP ports in one command, if configuring the destination IP address in a certain port fails, the rest IP port destination IP address configuration should be continued and return the cue which specific port configuring destination IP address fails, the format is: IP interface %s set target IP address unsuccessfully. Use IP table to replace %s in actual use. If only one port is configured successfully, the command line will return 'configuration successful' finally.

Use global configuration command **no ip dhcp relay ip-list target-ip** to delete the configured destination IP address of the IP port, or IP interface configuration command **no ip dhcp relay target-ip** in the corresponding port configuration mode.

Configuration example:

```
Raisecom#config
```

```
Raisecom(config)# ip dhcp relay ip-list all target-ip 10.199.0.200
```

```
Raisecom(config)# ip dhcp relay ip-list 1-3 target-ip 10.200.0.200
```

```
Raisecom(config)#interface ip 3
```

```
Raisecom(config-ip)#ip dhcp relay target-ip 10.201.0.200
```

```
Raisecom(config-ip)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show ip dhcp relay
```

The result is shown below:

```

DHCP Relay: Enabled
IP Interface   Enabled Status   Target IP Address
-----
0              enabled          10.199. 0.200
1              enabled          10.199. 0.200
10.200.0.200
2              enabled          10.199. 0.200
10.200.0.200
3              enabled          10.199. 0.200
10.200.0.200
10.201.0.200
4              enabled          10.199. 0.200
...           ...             ...

```

27.3.2.6 Configure DHCP Relay support option 82

By default, DHCP Relay do not support option 82, in global configuration mode use **ip dhcp relay information option** to start DHCP Relay support option 82.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp relay information	Start DHCP Relay support option 82
3	exit	Return to privileged EXEC mode

4	show ip dhcp relay information	Show DHCP Relay support Option 82 configuration information and port trust list
---	---------------------------------------	---

Notice: To active DHCP Relay support option 82, enable global DHCP Relay service first. To make option 82 function available, corresponding configuration on DHCP Server is needed.

Use global configuration command **no ip dhcp relay information option** to disable DHCP Relay support Option 82.

27.3.2.7 Configure DHCP Relay request message handling strategy

By default, DHCP Relay handling strategy to the client request messages is Replace, that is to fill Option 82 in the way of normal or verbose, replace the Option 82 contents that has been there and transmit it. In global configuration mode use the command **ip dhcp relay information policy {drop | keep | replace}** to configure the message handling strategy of DHCP Relay as drop, keep or replace.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp relay information policy {drop keep replace} [schedule-list list-no]	Configure DHCP Relay request message handling strategy
3	exit	Return to privileged EXEC mode
4	show ip dhcp relay information	Show DHCP Relay handling strategy to client request message

Notice: The command configured request message handling strategy can available only in DHCP Relay support Option 82.

Use global configuration command **no ip dhcp relay information policy {drop | keep | replace} [schedule-list list-no]** to recover default DHCP Relay handling strategy to Option 82.

The configuration example:

```
Raisecom#config
```

```
Raisecom(config) ip dhcp relay information policy keep
```

```
Raisecom(config)#exit
```

```
Raisecom#show ip dhcp relay information
```

The result is shown below:

```
Option 82: Enabled
```

```
Policy: Keep
```

```
Port          Trusted
```

```
-----
```

```
...          ...
```

27.3.2.8 Port DHCP Relay trust configuration

By default, if one DHCP message gateway address part is 0 and relay agent information option part (option 82) exists, then DHCP Relay will drop messages of this kind. If DHCP Relay is required to transmit messages of this kind, use the command to configure DHCP Relay port trust. After the specific port has configured DHCP Relay port trust command, these port can transmit this kind of DHCP messages normally. You can also use the key word all to set all the system port Relay Agent Information Option port trust.

When configuring port trust, except the configuration commands in config mode, you can configure the port trust state under the port directly as well, which is flexible.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp relay information trusted port-list 1-7	Set port 1-7 to trusted port
3	interface ip 8	Enter port 8 configuration mode
4	ip dhcp relay information trusted	Configure the destination IP 10.201.0.200
5	exit	Return to global configuration mode
6	exit	Return to privileged EXEC mode
7	show ip dhcp relay information	Show DHCP Relay support Option 82 configuration information and port trust table

Notice: Only when DHCP Relay support Option 82 can port trust take effect.

Use global configuration command **no ip dhcp relay information port-list** to set the port to distrust port, in the corresponding port configuration mode use port configuration command **no ip dhcp relay information option** to realize it.

Configuration example:

```
Raisecom#config
```

```
Raisecom(config) ip dhcp relay information trusted port-list 1-7
```

```
Raisecom(config)#interface ip 8
```

```
Raisecom(config-port)# ip dhcp relay information trusted
```

```
Raisecom(config-port)#exit
```

```
Raisecom(config)#exit
```

```
Raisecom#show ip dhcp relay information
```

The result is shown below:

Option 82: Disabled

Policy: Replace

<i>Port</i>	<i>Trusted</i>

1	yes
2	yes
3	yes
4	yes
5	yes
6	yes
7	yes
8	yes
...	...

27.3.3 Monitoring and maintaining

Use different show commands to show switch DHCP Relay running state and configuration state for monitoring and maintaining. All the show commands are listed below:

Command	Description
show ip dhcp relay	Show DHCP Relay configuration information
show ip dhcp relay statistics	Show DHCP Relay static.
show ip dhcp relay information	Show the configured neighbour DHCP proxy address information

Use the command **show ip dhcp relay** to show DHCP Relay basic configuration information, including DHCP Relay state, IP port DHCP Relay state and the corresponding DHCP proxy destination IP address.

Raisecom#**show ip dhcp relay**

DHCP Relay: Enabled

<i>IP Interface</i>	<i>Enabled Status</i>	<i>Target IP Address</i>

0	enabled	10.199. 0.200
1	enabled	10.199. 0.200
10.200.0.200		
2	enabled	10.199. 0.200
10.200.0.200		
3	enabled	10.199. 0.200
10.200.0.200		
10.201.0.200		

```
4          enabled          10.199. 0.200
...          ...              ...
```

Use the command **show ip dhcp relay statistics** to show DHCP Relay static, including DHCP Relay running time and received/sending messages number.

Raisecom#**show ip dhcp relay ip-pool**

Runtime: 0 hours 23 minutes 34 seconds

<i>Packet Type</i>	<i>Receive</i>	<i>Send</i>

<i>Bootp</i>	<i>0</i>	<i>0</i>
<i>Discover</i>	<i>1</i>	<i>1</i>
<i>Request</i>	<i>1</i>	<i>1</i>
<i>Decline</i>	<i>0</i>	<i>0</i>
<i>Offer</i>	<i>0</i>	<i>0</i>
<i>Ack</i>	<i>0</i>	<i>0</i>
<i>Nack</i>	<i>0</i>	<i>0</i>
<i>Decline</i>	<i>0</i>	<i>0</i>
<i>Inform</i>	<i>0</i>	<i>0</i>
<i>Unknowns</i>	<i>0</i>	<i>0</i>
<i>Total</i>	<i>2</i>	<i>2</i>

Use the command **show ip dhcp relay information** to show DHCP Relay support Option 82 configuration information and port trust table:

Raisecom#**show ip dhcp relay information**

In English:

Option 82: Enabled

Policy: Replace

<i>Port</i>	<i>Trusted</i>

<i>1</i>	<i>yes</i>
<i>2</i>	<i>no</i>
<i>3</i>	<i>yes</i>
<i>4</i>	<i>yes</i>

... ..

Instruction:

DHCP Relay supporting Option 82 includes:

- a) Enabled
- b) Disabled

The strategy includes:

- a) Drop
- b) Keep
- c) Replace

27.3.4 Typical configuration example

DHCP Relay typical configuration example is like DHCP Server typical configuration example. The following is about a example that the client using DHCP Snooping connects to DHCP Relay and get IP address.

1) Configuration instruction

1: the connection of starting Snooping on DHCP Snooping equipment is as fig 3-2, start DHCP Snooping support option 82, and set port 2 to DHCP Snooping trust port.

2: DHCP Relay divides two subnets, the connection between it and the client and the server connection and configuration is as the figure below. Follow the figure to configure VLAN, IP port address and the VLAN that the port belongs to.

3: DHCP Server divides two subnets, establish correct address pool (10.150.0.2 – 10.150.0.100) on the subnet, start DHCP Server function at the same time and configure relay-ip shown in the figure (consult DHCP Server module configuration guide). Then follow the figure to configure VLAN, IP port address and VLAN the port belongs to, and configure it to the router belongs to 10.150 network segment.

4: set PCI to auto acquiring IP address.

2) Topology figure

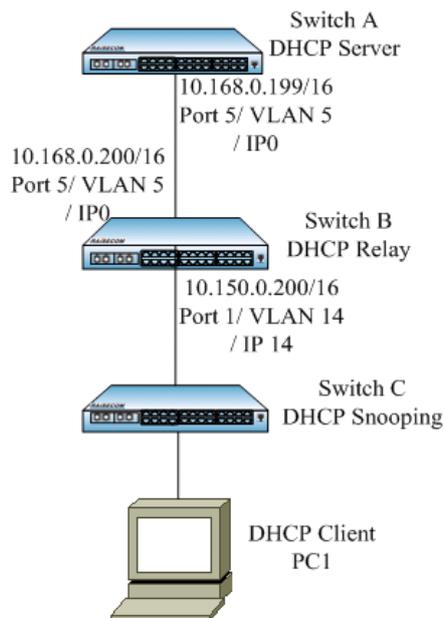

Fig 3-2 typical configuration example

3) Configuration steps:

Configure DHCP Relay:

Start global DHCP Relay

Raisecom (config)#**ip dhcp relay**

Prot 14 configure destination IP addresss

Raisecom (config)# **ip dhcp relay ip-list 14 target-ip 10.168.0.199**

Start DHCP Realy support option 82

Raisecom (config)**ip dhcp relay information option**

Configure port 1 as DHCP Relay trust port

Raisecom (config)**ip dhcp relay information trusted port-list 1**

Open the router function

Raisecom (config)#**ip dhcp relay ip routing**

a) show the result

Show the client PC1

C:\>ipconfig /all

Ethernet adapter local connection

Connection-specific DNS Suffix . . . :

Description : Realtek RTL8139/810x Family Fast Ethernet NIC

Physical Address. : 00-50-8D-4B-FD-27

Autoconfiguration Enable. . . :Yes

IP Address. : 10.150.0.0

Subnet Mask : 255.255.0.0

Default Gateway :
DHCP server : 10.168.0.199
DNS Servers :
Lease Obtained. : 13:03:24 April 8, 2007
Lease Expires. : 13:33:24 April 8, 2007

27.3.5 DHCP Relay trouble shooting

1. If the correct destination IP address is not designated, DHCP Relay can not transmit the message correctly.
2. If the gateway address field of a DHCP message is 0 and relay agent information option field exists, DHCP Relay distrusted port will drop messages of this kind.

If the configuration above still can not help, please examine if DHCP Relay has started router function, and examine if DHCP server address is correctly configured, if the neighbor proxy default gateway or router is configured.

27.4 DHCP Option Configuration

This chapter is mainly about how to configure and maintain DHCP Option, including:

- ✧ DHCP Option principle overview
- ✧ DHCP Option configuration
- ✧ Monitoring and maintenance
- ✧ Typical configuration example
- ✧ DHCP Option trouble shooting

27.4.1 DHCP Option principle overview

There are kinds of request options in DHCP request messages, while one special option exists in DHCP snooping, DHCP relay, DHCP server request and answer messages, which is used to mark the client's position. This option is OPTION82, including two sub-options: circuit-id and remote-id. With the two sub-options, the server is able to acquire the position information of the client and take effective management.

27.4.2 DHCP Option configuration

This part is about how to configure DHCP OPTION on the switch, including:

Default DHCP OPTION configuration

DHCP OPTION configuration guide

Global DHCP OPTION attach-string configuration

DHCP OPTION circuit-id configuration in port mode

DHCP OPTION remote-id configuration in global mode

1.4.2.1 Default DHCP OPTION configuration

The table below lists the default DHCP OPTION configuration:

Function	Default value
Global attach-string configuration	Empty
Global remote-id configuration	switch-mac
In port mode circuit-id	Empty

27.4.2.2 DHCP OPTION configuration guide

If the equipment supports DHCP Snooping or DHCP Relay, then DHCP Option module can be configured on it.

27.4.2.3 Configure global DHCP OPTION attach-string

By default, global DHCP OPTION attach-string is empty, and the value will be the configured value after configuration. The format of option 82 sub-option 1 in DHCP OPTION message is:

Port number/VLAN ID/attach-string

Configuration steps:

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp information option attach-string raisecom	Configure DHCP OPTION attach-string to raisecom
3	exit	Return to privileged EXEC mode
4	show ip dhcp information option	Show DHCP OPTION module configuration

27.4.2.4 Configure DHCP OPTION circuit-id in port mode

By default, port circuit-id is empty, and the value will be the configured value after configuration. The format of option 82 sub-option 1 in DHCP OPTION message is:

Circuit-id

The configuration steps:

Step	Command	Description
1	config	Enter global configuration mode
2	interface port 10	Enter port 10 configuration mode
3	ip dhcp information option circuit-id raisecom	Configure port 10 circuit-id to raisecom
4	exit	Return to global configuration mode

5	exit	Return to privilege EXEC mode
6	show ip dhcp information option	Show DHCP OPTION module configuration

27.4.2.5 Configure DHCP OPTION remote-id in global configuration mode

By default, remote-id mode is switch-mac mode, when this option is configured, DHCP OPTION82 can be sent out in the configured mode.

Switch-mac: remote-id will be sent out in the form of switch MAC address binary system;

Client-mac: remote-id will be sent out in the form of client equipment MAC address binary system;

Switch-mac-string: remote-id will be sent out in the form of switch MAC address character string;

Client-mac-string: remote-id will be sent out in the form of client MAC address character string.

The configuration steps:

Step	Command	Description
1	config	Enter global configuration mode
2	ip dhcp information option remote-id switch-mac-string	Configure remote-id being sent out in the form of switch MAC address character string
3	exit	Return to privileged EXEC mode
4	show ip dhcp information option	Show DHCP option module configuration

27.4.3 Monitoring and maintenance

Use **show** to show the switch DHCP OPTOIN configuration

Command	Description
show ip dhcp information option	Show DHCP OPTION configuration

Use **show ip dhcp information option** to show basic DHCP OPTION configuration, including global DHCP OPTION82 sub-option circuit state, circuit-id configuration in port mode, remote-id configuration mode.

Raisecom#**show ip dhcp information option**

Switch use attach string as circuit ID

attach-string: raisecom

remote ID use switch MAC-address as string mode

27.4.4 Typical configuration example

If the carrier do not configure OPTION module

If the carrier do not configure DHCP OPTION, the switch will mark the client device position in

default way

If the carrier wants to mark the client device position

If the carrier wants to mark the client device position in the way of attach-string

Configure attach-string in global configuration mode

Raisecom(config)#**ip dhcp information option attach-string** *STRING*

The client position information is as follows:

Port number\VLAN\STRING MAC address (the carrier can choose MAC address mode)

If the carrier wants to mark client device position completely in its own way

In port configuration mode, the carrier is able to mark the client position in its own way, for example, one carrier needs the client mark shown as follows:

Option 1

<Access-Node-Identifier>/<PON>/<rack> / <shelf> / <slot> / <PON> : <ONT> . <ONT-slot> . <UNI>

<Access-Node-Identifier>

<rack>

<shelf>

<slot>

<PON>

<ONT>

<ONT-SLOT>

<UNI>

Circuit-id can be configure to the needed format in port mode, the steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface port 10	Enter port 10 configuration mode
3	ip dhcp information option circuit-id <i>CHINA/PON/1/1/08/01:28.1.10</i>	Configure port 10 circuit-id to CHINA/PON/1/1/08/01:28.1.10
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show ip dhcp information option	Show DHCP OPTION module configuration

27.4.5 DHCP OPTION trouble-shooting

N/A

Chapter 28 DHCP Client

This chapter is mainly about how to configure and maintain DHCP Client on the switch, including:

- ✧ DHCP Client overview
- ✧ DHCP Client configuration
- ✧ Monitoring and maintenance
- ✧ Typical configuration example
- ✧ DHCP Client trouble shooting

28.1 DHCP client overview

DHCP (Dynamic Host Configuration Protocol) is a protocol to offer client device the configuration information. Based on BOOTP, it adds some function like assigning available network address automatically, network address reuse and other extension configuration. The two protocols can do some interoperation with some mechanism. DHCP offers configuration parameters to the network host, which can be divided into two basic parts: one is offering specific configuration information to network host, the other part is assigning network address to the host. DHCP is based on client/server mode, where the designated host offers network address and configuration information to the needed host. The designated host is called server.

Usually, DHCP server is used to accomplish IP address assignation in the following situations:

- 1) Large network scale, it is much too verbose for manual configuration, and cluster management is difficult.
- 2) In the network the host number is larger than supported IP address number, the system can not offer a static IP address for each host, and the user number access to the network is also limited (for example, Internet service provider is of the situation), lot of users must use DHCP service to get IP address.
- 3) Only a few hosts need static IP addresses, most hosts do not need that.

There are usually one host and multiple clients (like PC and portable devices) in a typical DHCP application.

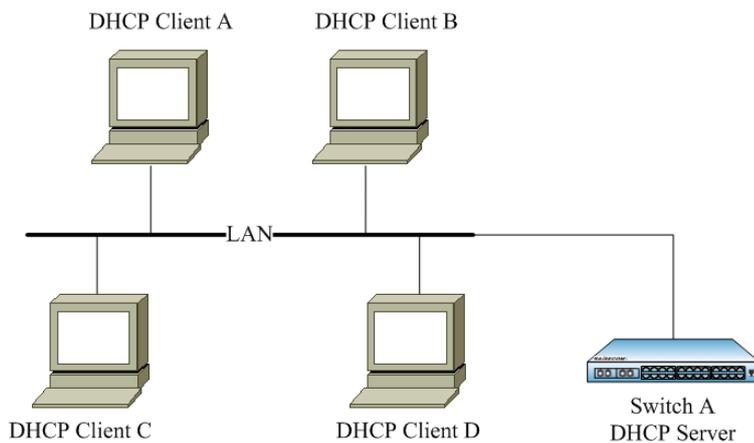

Fig 1-1 Typical DHCP ClientQ application

28.2 Configure DHCP Client

The part is about how to configure DHCP Client on the switch, including:

- ✧ Default DHCP Client configuration
- ✧ DHCP Client configuration guide
- ✧ Configure IP port 0 getting IP address by DHCP
- ✧ DHCP Client renew
- ✧ DHCP Client releasing IP address
- ✧ Configure hostname/class-id/client-id

Attention:

- To ISCOM serious devices, the commands related to DHCP Client is under IP port; when it comes to RC551 devices, they are in global configuration mode.

28.2.1 Default DHCP Client configuration

Function	Default value
hostname	raisecomFTTH
class-id	raisecomFTTH-ROS_VERSION
client-id	raisecomFTTH-SYSMAC- IF0
The IP port acquiring IP address by DHCP	N/A
DHCP Client renew	N/A
DHCP Client release IP address	N/A

28.2.2 DHCP Client configuration guide

1. Make sure that DHCP Server or DHCP Relay is not enabled on the switch;
2. To a switch, only IP port 0 supports DHCP Client function;
3. When DHCP Client is enabled, DHCP Server or DHCP Relay can not be enabled on the switch
4. Before using the command, you should make sure that the designated VLAN has been created manually, and the port that IP port lays in has joined the VLAN, while DHCP server has been configured. Or IP address will not be acquired successfully by DHCP.
5. If IP port 0 has been configured acquiring IP address from DHCP, then it not allowed to configure IP address manually under the port.
6. If IP port 0 has acquired IP address form DHCP, run **ip address dhcp {1-4094} [server-ip ip-address]**, and if the acquired address is different from the designated VLAN or DHCP Server IP address , then the port will release the acquired IP address and start a new application.
7. To port 0, the IP address acquired from DHCP and the manually configured one can cover each

other.

8. If IP port 0 has acquired IP address by DHCP, then it will start IP address renewal automatically.
9. If the client goes through multiple Relay to acquire IP address from DHCP server, make sure that each device is connected and configured correctly. The number of DHCP Relay between the client and server should not exceed 16 in RFC1542, and it is usually recommended not to pass 4.

28.2.3 Configure IP port 0 applying IP address by DHCP

In IP port 0 (only IP port 0), enable DHCP Client, and the device will acquire IP address and requested parameters in the designated VLAN. The parameters includes: gateway address (option 3), TFTP server name (option66), TFTP server address (option 150), configured filename (option 67).

If DHCP server does not support option 150, then you can configure TFTP server address in option 66, which is also supported by DHCP Client.

If one IP address has been configured to IP port 0, then no matter if default gateway configuration successes or not, DHCP Client is thought to have acquired IP address successfully from the server.

The configuration steps are shown below:

Step	Command	Description
1	config	Enter global configuration mode
2	interface ip 0	Enter IP port 0 configuration mode
3	ip address dhcp 1	Configure IP port 0 acquiring IP address by DHCP
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show ip dhcp client	Show DHCP Client configuration and the acquired information (run the command when the application ends)

Attention:

- If DHCP Server or DHCP Relay has been enabled on the switch, DHCP Client can not longer be enabled.
- If DHCP Client has been enabled on the switch, then DHCP server or DHCP Relay can not be enabled.

28.2.4 DHCP Client renewal

In IP port 0, if IP address has been acquired through DHCP, then you can use the command to renew.

When renewing, the result will be shown in the command lines automatically. If renew successes will be typed out by SYSLOG.

The steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface ip 0	Enter IP port 0 configuration mode
3	ip dhcp client renew	DHCP Client renew
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show ip dhcp client	Show DHCP Client configuration and the acquired information (execute the command when renewal ends)

Attention:

- The command is available only when IP port 0 has acquired IP address through DHCP.

28.2.5 DHCP Client release IP address

In IP port 0, the steps to release the IP address and other information (like gateway address, TFTP server host name, TFTP server IP address and configured filename) are shown below:

Step	Command	Description
1	config	Enter global configuration mode
2	interface ip 0	Enter IP port 0 configuration mode
3	no ip address dhcp	DHCP Client release IP address
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show ip dhcp client	Show DHCP Client configuration information and the acquired information

Attention:

- Only when DHCP Client has been enabled in IP port 0 can the command takes effect.

28.2.6 Configure hostname/class-id/client-id

In IP port 0, configure hostname, class-id and client-id for DHCP Client, which will be used when DHCP Client is sending out messages. Take configuring hostname for example, it is similar when configuring class-id and client-id.

The steps are shown below:

Step	Command	Description
1	config	Enter global configuration mode

2	interface ip 0	Enter IP port 0 configuration mode
3	ip dhcp client hostname myhost	Configure hostname to myhost
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show ip dhcp client	Show DHCP Client configuration and acquired information

Attention:

- No matter if DHCP Client has been enabled, hostname, class-id or client-id can be configured. When IP port 0 applies IP address by DHCP Client, current hostname, class-id or client-id is used; when DHCP Client renews, hostname, class-id or client-id should be the same with the one when it is applying IP address.

28.3 Monitoring and maintenance

Use different **show** to show DHCP Client running state and configuration. All the listed **show** commands are shown below:

Command	Description
show ip dhcp client	Show DHCP Client configuration and the acquired information

Use **show ip dhcp client** to show the configuration and acquired information of DHCP Client. The configuration includes: hostname, class-id and client-id. The acquired information includes: the acquired IP address, subnet mask, default gateway, lease length, lease starting and ending time, server address, TFTP server hostname, TFTP server IP address and the configuration filename.

Raisecom#show ip dhcp client

Feedback 1: IP port 0 has acquired IP address through DHCP:

```

Hostname:          raisecomFTTH
Class-ID:          raisecomFTTH-3.5.856
Client-ID:         raisecomFTTH-000e5e48e596-IF0

```

```

Assigned IP Addr:  10.0.0.5
Subnet mask:       255.0.0.0
Default Gateway:   10.0.0.1
Client lease Starts: Jan-01-2007 08:00:41
Client lease Ends:  Jan-11-2007 11:00:41
Client lease duration: 874800(sec)
DHCP Server:       10.100.0.1

```

```

Tftp server name:  TftpServer
Tftp server IP Addr: 10.168.0.205

```

Startup_config filename: 2109.conf

Feedback 2: IP port 0 is acquiring IP address through DHCP:

```

Hostname:          Raisecom
Class-ID:          Raisecom-3.5.856
Client-ID:         Raisecom-000e5e48e596-IF0

```

DHCP Client is requesting for a lease.

Feedback 4: applying IP address fails, no available lease information:

```

Hostname:          Raisecom
Class-ID:          Raisecom-3.5.856
Client-ID:         Raisecom-000e5e48e596-IF0

```

No lease information is available.

P.S.:

The blue words, if DHCP Server do not support the option, then replace it with – when showing DHCP Client.

28.4 Typical configuration example

The example is simple but classical on the process of configuring DHCP Client.

1. Configuration instruction:

The two DHCP clients connect DHCP server by port 2 and 3 respectively.

- 1) Configure direct ip pool on DHCP Server, and enable DHCP Server globally.
- 2) Configure the two DHCP client acquiring IP address and other configuration information by DHCP.

2. Topology

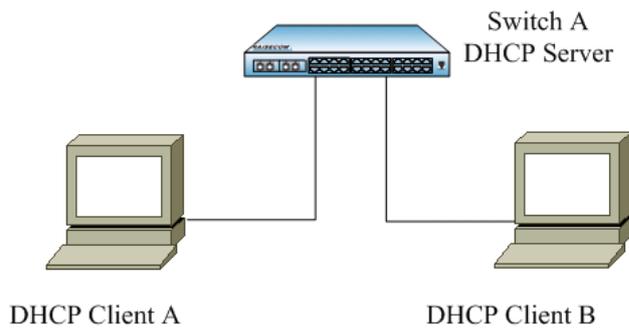

Fig 1-2 Typical configuration example

3. The configuration steps:

Only the configuration steps of Client A are listed here, the steps of the other one is the same and will not be listed.

- Configure IP port 0 acquiring IP address by DHCP:

```
Raisecom(config)# interface ip 0
```

```
Raisecom(ip-config)#ip address dhcp 1
```

4. Show

On DHCP Client, use **show ip dhcp client** to show the client IP address applied from DHCP and other configuration information.

Raisecom(config)# **show ip dhcp client**

```
Hostname:          raisecomFTTH
Class-ID:          raisecomFTTH-3.6.1025
Client-ID:         raisecomFTTH-000e5e8a0798-IF0
Assigned IP Addr:  10.0.0.5
Subnet mask:       255.0.0.0
Default Gateway:   10.0.0.1
Client lease Starts: Jan-01-2007 08:00:41
Client lease Ends:  Jan-11-2007 11:00:41
Client lease duration: 874800(sec)
DHCP Server:       10.100.0.1

Tftp server name:  --
Tftp server IP Addr: 10.168.0.205
Startup_config filename: 2109.conf
```

28.5 DHCP Client trouble shooting

1. Make sure that DHCP server is able to support option 1, option 3, option 66, option 67, option 150. If some option is not supported, DHCP can not get information of this kind, but for still can get IP address.
2. If the device as DHCP Client starts DHCP Snooping as well, make sure the port it uses to connect DHCP server is the trusted port. Or DHCP Client can not get IP address.

Chapter 29 802.1x

29.1 802.1x principle overview

802.1x module is based on IEEE802.1x protocol, or port based network access control technology, it makes authorization and control to access equipments on the equipments' physical access layer, and defines the point-to-point connection mode between the access equipment and access port.

The system structure of IEEE 802.1x includes three parts:

- ✓ Supplicant
- ✓ Authenticator
- ✓ Authorization Server

LAN access control equipment (like access switch) needs the Authenticator of 802.1x; user side equipment, like computer, needs to install 802.1x client (Supplicant) software (or the 802.1x client pre-positioned in Windows XP); while 802.1x Authorization Server System usually stays in operator's AAA centre.

Authenticator and Authorization Server exchange information using Extensible Authorization Protocol; while Supplicant and Authenticator use EAPOL (EAP over LANs, defined in IEEE802.1x) for communication, the authorization data is encapsulated in EAP frame. The authorization data is encapsulated in the message of other AAA upper layer protocol (like RADIUS) so that it is able to go through complicated network and reach Authorization Server, this process is called EAP Realy.

The figure below is 802.1x system structure:

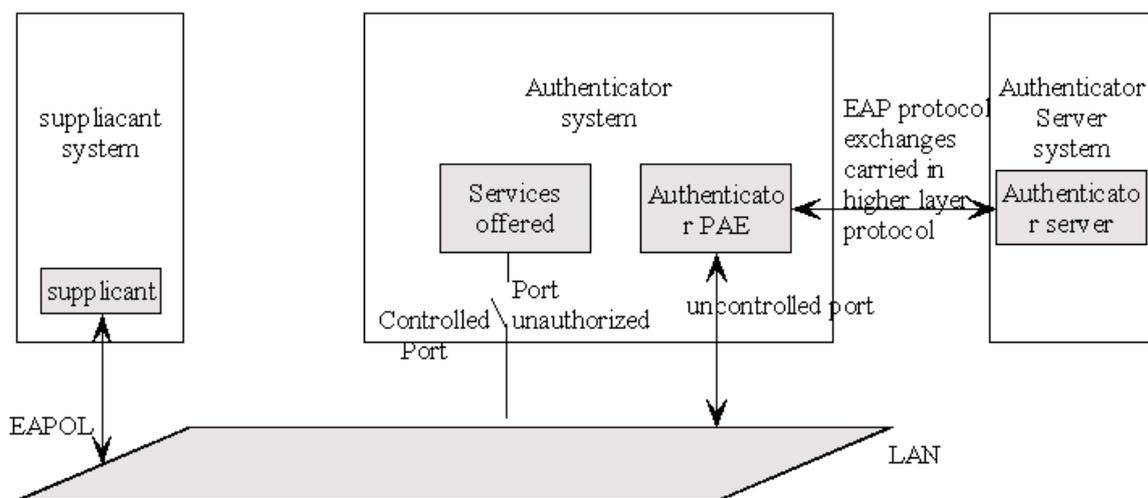

Fig 1: 802.1x system structure

'port based network access control' means to do authorization and control to the access equipments in LAN access control equipment port layer. If the user equipment connected to the port can go through the authorization, then it is able to visit the resources in LAN; if it can not pass the authorization, then it can not visit the network resources through switch – same as physical link down.

29.2 Configure 802.1x

802.1x configuration includes:

1. Default 802.1x configuration situation;
2. Enable/disable 802.1x global feature and port feature;
3. Configure RADIUS server IP address and RADIUS public key;
4. Show RADIUS server configuration;
5. Configure port access control mode;
6. Enable/disable 802.1 x reauthorization function;
7. Configure 802.1x reauthorization period;
- 8 Configure 802.1x silence time;
9. Configure Request/Identity resending period;
10. Configure Request/Identity resending period;
11. Configure RADIUS server overtime.

29.2.1 Default 802.1x configuration

Function	Default value
Global 802.1x feature	disable
Port 802.1x feature	disable
Port access control mode	auto
RADIUS server overtime	100s
802.1x reauthorization function	disable
802.1x reauthorization period	3600s
802.1 silence time	60s
Request/Identity resending period	30s
Request/Challenge resending period	30s

29.2.2 Basic 802.1x configuration

The basic 802.1x configuration is shown below:

- ✓ Enable/disable 802.1x global feature and port feature;
- ✓ Configure RADIUS server IP address and RADIUS public key;
- ✓ Configure port access control mode.

1. Enable/disable 802.1x global feature and port feature;

802.1x feature includes global 802.1x feature and port 802.1x feature, if one of them is not enabled, it will lead to 802.1x feature shown as constraint authorization passing through. 802.1x protocol and spanning tree protocol (STP) can not be opened at the same time in the same port.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	dot1x { disable enable }	Enable/disable global 802.1x feature
3	interface { port line client } <1- MAX_PORT_NUM >	Enter ethernet physical port mode 1- MAX_PORT_NUM the equipment port
4	dot1x { disable enable }	Enable/disable port 802.1x feature
5	exit	Return to global configuration mode
6	exit	Return to privileged EXEC mode
7	show dot1x { port-list line client } portlist	Show physical port 802.1x configuration information <i>Portlist</i> use ‘_’ and ‘,’ to input more ports number

Notice:

➤ If a port has enabled STP and 802.1x protocol port can not be opened successfully, we need to disable port STP first.

➤ 802.1x protocol is physical port based access control protocol, it is not suggested that user enable 802.1x feature on aggregation port and not-Access port. When several users connects to the same switch port using shared network, if one user passes the authorization, then other users do not need authorization before they visit the network, but in this situation several user doing authorization at the same time may cause unsuccessful authorization because of interaction.

2. Configure RADIUS server IP address and RADIUS public key:

Configuring RADIUS server IP address and RADIUS public key is a necessary precondition of 802.1x port authorization.

The configuration steps are as follows:

Step	Command	Description
1	[no] radius ipaddress	Configure RADIUS server IP address
2	[no] radius-key string	Configure RADIUS server public key
3	show radius-server	Show RADIUS server configuration information

3. Configure port access control mode:

Port access control mode can be divided into three states: auto, authorized-force, unauthorized-force. By default it is auto. When global 802.1x feature and port 802.1x feature is on, the configuration determines directly if the authorization process will use authorized-force, unauthorized-force or protocol control mode.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client} <i><1-MAX_PORT_NUM ></i>	Enter ethernet physical port mode <i>1- MAX_PORT_NUM</i> equipment port
3	dot1x auth-control {auto/ authorized-force/ unauthorized-force}	Configure port control mode
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show dot1x {port-list line client} <i>portlist</i>	Show physical port 802.1x configuration information <i>portlist</i> : use ‘_’ and ‘,’ to input more port numbers.

29.2.3 802.1x reauthorization configuration

Reauthorization function is for authorized users, so you should make sure that global and port 802.1x feature are enabled. By default reauthorization function is disabled. The authorized port keeps the state of authorized in the process of authorization; if reauthorization failed, then the port will enter unauthorized state.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface {port line client} <i><1-MAX_PORT_NUM ></i>	Enter ethernet physical port mode <i>1- MAX_PORT_NUM</i> equipment port
3	dot1x reauthentication <i>{enable/disable}</i>	Enable/disable reauthorization function
4	exit	Return to global configuration mode
5	exit	Return to privileged EXEC mode
6	show dot1x {port-list/line/client} <i>portlist</i>	Show physical port 802.1x configuration information <i>Portlist</i> , use ‘_’ and ‘,’ to input more port numbers

29.2.4 Configure 802.1x timer

In 802.1x authorization process, there are 5 timers related:

1. reauth-period: reauthorization overtime timer. In the time configured by the timer, 802.1x reauthorization will be raised. Reauth-period-value: the time length configured by reauthorization overtime timer, range is

- 1-65535, unit is second. By default it is 3600 seconds.
2. **quit-period:** quiet timer. When user authorization failed, the switch needs to keep quiet for a period of time, which is configured by quiet timer. When quiet timer exceeds the time it will make reauthorization. In quiet time, the switch will not process authorization messages. **Quiet-period-value:** the quiet time value configured by quiet timer, rang is 10-120, unit is second. By default, quiet-period-value is 60 seconds;
 3. **tx-period:** transmission overtime timer. When the switch sends Request/Identity messages to user request end, the switch will start the timer, if in the configured time length user end software can not send request answering messages, the switch will re-send authorization request message, which will be sent three times. **Tx-period-value:** the time length configured by sending overtime timer, range is 10-120, unit is second. By default tx-period-value is 30 seconds.
 4. **supp-timeout:** Supplicant authorized timeout timer. When the switch sends Request/Challenge message to user request end, the switch will start supp-timeout timer. if the user request end can not react in the time length configured in the timer, the switch will re-send the message twice. **Supp-timeout-value:** the time length configured by Supplicant authorization overtime timer, range is 10-120, unit is second. By default supp-timeout-value is 30 seconds.
 5. **server-timeout:** Authentication Server. The timer defines the authenticator and the total overtime-length of RADIUS server dialog, when the timer exceeds the time the authenticator will end the dialog with RADIUS server, and start a new authorization process. The resending times and interval of RADIUS is determined by the switch RADIUS client. The switch RADIUS client message resend 3 times, while the waiting time is 5s. **server-timeout-value:** the overtime length configured by RADIUS server timer, range is 100-300, unit is second. By default server-timeout-value is 100s.

The configuration steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	interface { port line client } <i><I- MAX_PORT_NUM ></i>	Enter ethernet physical port mode
3	[no] dot1x timer reauth-period <i>reauth-period-value</i>	Configure reauthorization timer value Range is 1-65535, unit is second. By default the value is 3600s
4	[no] dot1x timer quiet-period <i>quiet-period-value</i>	Configure quiet-time timer value Range is 10-120, unit is second. By default quiet-period-value is 60s
5	[no] dot1x timer tx-period <i>tx-period-value</i>	Configure Request/Identity resending timer value Range is 10-120, unit is second. By default tx-period-value is 30s
6	[no] dot1x timer supp-timeout <i>supp-timeout-value</i>	Configure Request/Challenge resending timer value Range is 10-120, unit is second. By default supp-timeout-value is 30s
7	[no] dot1x timer server-timeout <i>server-timeout-value</i>	Configure RADIUS server overtime timer value Range is 100-300, unit is second. By default server-timeout-value is 100s

8	exit	Return to global configuration mode
9	exit	Return to privileged EXEC mode
10	show dot1x { port-list line client } portlist	Show physical port 802.1x configuration information Portlist, use '_' and ',' to input more port numbers.

29.2.5 802.1x statistics cleanup

Monitoring and port statistics information is used to count the EAPOL messages number for the switches and user end exchanging data. Cleaning port stat. will clean all the statistics information of the selected ports. The steps are as follows:

Step	Command	Description
1	config	Enter global configuration mode
2	clear dot1x{ port-list line client } portlist statistics	Clear physical port 802.1x statistics information
3	exit	Return to privileged EXEC mode
4	show dot1x { port-list line client } portlist statistics	Show physical port 802.1x statistics information Portlist, use '_' and ',' to input more port numbers.

29.2.6 Maintenance

Use **show** to show the configuration and running state of switch 802.1x function for the convenience of monitoring and maintenance.

The related **show** commands are shown below:

Commands	Description
show radius-server	Show RADIUS server configuration
show dot1x { port-list line client } portlist	Show physical port 802.1x configuration information
show dot1x { port-list line client } portlist statistics	Show physical port 802.1x statistics information

29.2.7 Configuration example

1. Configuration request:

- PC user can visit outer network after passing ARDIUS server authorization
- In authorization-force mode, PC needs not authorization before visiting outer network;
- In unauthorization-force mode, PC can not visit outer network;
- After passing authorization, PC will do reauthorization 600s later automatically.

2. Network structure:

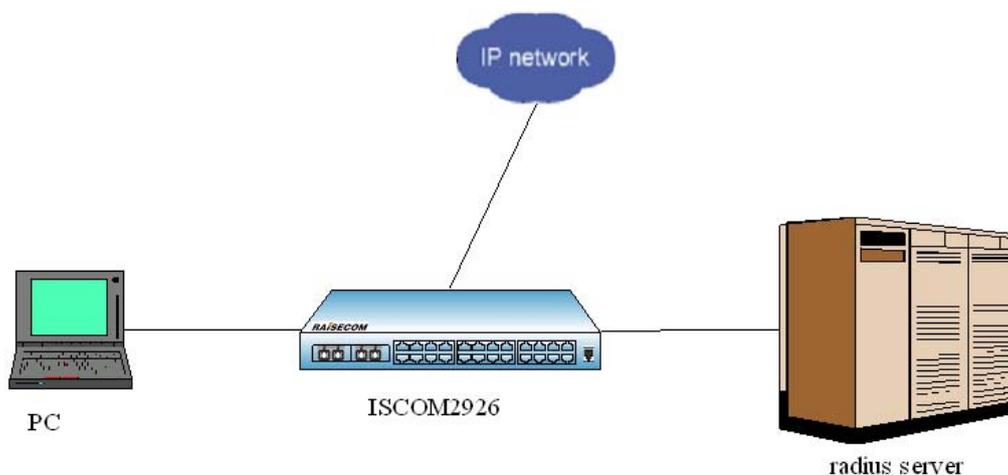

Fig 2: network structure

3. Configuration steps:

- Configure RADIUS server:

Follow ISCOM switch 802.1x user guide, add user raisecom in the server, the password is 123;

- Configure switch IP address and RADIUS server address:

```
Raisecom(config)#interface ip 0
```

```
Raisecom(config-ip)#ip address 10.10.0.1 255.255.0.0 1
```

```
Raisecom(config-ip)#exit
```

```
Raisecom(config)#ip default-gateway 10.10.0.2
```

```
Raisecom(config)#exit
```

```
Raisecom# radius 192.168.0.1
```

```
Raisecom# radius-key raisecom
```

- Configure enabling global and port 802.1x authorization function:

```
Raisecom(config)#dot1x enable
```

```
Raisecom(config)#interface port 1
```

```
Raisecom(config-port)#spanning-tree disable(STP and 802.1x are mutex)
```

```
Raisecom(config-port)# dot1x enable
```

- PC end uses the client software for authorization request, username: raisecom, password: 123; The PC client software will inform passing authorization, then we can visit outer network;
- Change the authorization mode to authorization-force mode:

Raisecom(config)#**interface port 1**

Raisecom(config-port)#**dot1x auth-control authorized-force**

- PC end uses the client software for authorization request, username: raisecom, password: 123;
The PC client software will inform passing authorization, then we can visit outer network;

- Chang authorization-force mode to unauthorization-force mode

Raisecom(config)#**interface port 1**

Raisecom(config-port)#**dot1x auth-control unauthorized-force**

- PC end uses the client software for authorization request, username: raisecom, password: 123;
The PC client software will inform passing authorization, then we can visit outer network;

- Enable reauthorization, and configure the time to 600s:

Raisecom(config)#**interface port 1**

Raisecom(config-port)#**dot1x reauthentication enable**

- Show the statistics information:

Raisecom#**show dot1x port-list 1 statistics**

Notice: The switch's IP address, RADIUS server IP and key must well configured first of all;
